MITSUBISHI ELECTRIC

PROGRAMMABLE CONTROLLERS

MELSEC-F

FX3U-CAN

USER'S MANUAL

Safety Precautions

(Read these precautions before use.)

Before installation, operation, maintenance or inspection of this product, thoroughly read through and understand this manual and all of the associated manuals. Also, take care to handle the module properly and safely.

This manual classifies the safety precautions into two categories: ⚠WARNING and ⚠CAUTION.

⚠WARNING	Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.
⚠CAUTION	Indicates that incorrect handling may cause hazardous conditions, resulting in medium or slight personal injury or physical damage.

Depending on the circumstances, procedures indicated by ⚠CAUTION may also cause severe injury.
It is important to follow all precautions for personal safety.
Store this manual in a safe place so that it can be taken out and read whenever necessary. Always forward it to the end user.

1. DESIGN PRECAUTIONS

⚠WARNING	Reference
• Make sure to have the following safety circuits outside of the PLC to ensure safe system operation even during external power supply problems or PLC failure. Otherwise, malfunctions may cause serious accidents. 1) Most importantly, have the following: an emergency stop circuit, a protection circuit, an interlock circuit for opposite movements (such as normal vs. reverse rotation), and an interlock circuit (to prevent damage to the equipment at the upper and lower positioning limits). 2) Note that when the PLC CPU detects an error, such as a watchdog timer error, during self-diagnosis, all outputs are turned off. Also, when an error that cannot be detected by the PLC CPU occurs in an input/output control block, output control may be disabled. External circuits and mechanisms should be designed to ensure safe machinery operation in such a case. • For the operating status of each node in the case of a communication error, see the FX3U-CAN user's manual and the product manual of each node. Erroneous output or malfunctions may cause an accident. • When executing control (data changes) to an operating PLC, construct an interlock circuit in the sequence program so that the entire system operates safely. In addition, when executing control such as program changes and operation status changes (status control) to an operating PLC, carefully read the manual and sufficiently confirm safety in advance. Especially in control from external equipment to a PLC in a remote place, problems in the PLC may not be able to be handled promptly due to abnormality in data transfer. Construct an interlock circuit in the sequence program. At the same time, determine the actions in the system between the external equipment and the PLC for protection against abnormalities in data transfer.	24

⚠CAUTION	Reference
• Make sure to observe the following precautions in order to prevent any damage to the machinery or accidents due to abnormal data written to the PLC under the influence of noise: 1) Do not bundle the main circuit line together with or lay it close to the main circuit, high-voltage line or load line. Otherwise, noise disturbance and/or surge induction are likely to take place. As a guideline, lay the control line at least 100mm (3.94") or more away from the main circuit or high-voltage lines. 2) Ground the shield wire or shield of a shielded cable. Do not use common grounding with heavy electrical systems (refer to the manual of the PLC main unit).	24

2. INSTALLATION PRECAUTIONS

⚠WARNING	Reference
• Make sure to cut off all phases of the power supply externally before attempting installation or wiring work. Failure to do so may cause electric shock or damage to the product.	26

⚠CAUTION	Reference
• Use the product within the generic environment specifications described in PLC main unit manual (Hardware Edition). Never use the product in areas with excessive dust, oily smoke, conductive dusts, corrosive gas (salt air, Cl2, H2S, SO2 or NO2), flammable gas, vibration or impacts, or expose it to high temperature, condensation, or rain and wind. If the product is used in such conditions, electric shock, fire, malfunctions, deterioration or damage may occur. • Do not touch the conductive parts of the product directly. Doing so may cause device failures or malfunctions. • When drilling screw holes or wiring, make sure that cutting and wiring debris do not enter the ventilation slits. Failure to do so may cause fire, equipment failures or malfunctions. • Be sure to remove the dust proof sheet from the PLC's ventilation port when installation work is completed. Failure to do so may cause fire, equipment failures or malfunctions. • Install the product on a flat surface. If the mounting surface is rough, undue force will be applied to the PC board, thereby causing nonconformities. • Install the product securely using a DIN rail or mounting screws. • Connect extension cables securely to their designated connectors. Loose connections may cause malfunctions.	26

3. WIRING PRECAUTIONS

⚠WARNING	Reference
• Make sure to cut off all phases of the power supply externally before attempting installation or wiring work. Failure to do so may cause electric shock or damage to the product.	29

⚠CAUTION	Reference
• Perform class D grounding (grounding resistance: 100Ω or less) to the shield of the twisted shield cable (refer to Subsection 4.2.3). Do not use common grounding with heavy electrical systems. • When drilling screw holes or wiring, make sure cutting or wire debris does not enter the ventilation slits. Failure to do so may cause fire, equipment failures or malfunctions. • Install module so that excessive force will not be applied to communication connectors or communication cables. Failure to do so may result in wire damage/breakage or PLC failure. • Make sure to affix the CAN bus connector with fixing screws. Tightening torque should follow the specifications in the manual. Loose connections may cause malfunctions. • Make sure to properly wire to the terminal block (CAN bus connector) in accordance with the following precautions. Failure to do so may cause electric shock, equipment failures, a short-circuit, wire breakage, malfunctions, or damage to the product. - The disposal size of the cable end should follow the dimensions described in the manual. - Tightening torque should follow the specifications in the manual. - Twist the end of strand wire and make sure that there are no loose wires. - Do not solder-plate the electric wire ends. - Do not connect more than the specified number of wires or electric wires of unspecified size. - Affix the electric wires so that neither the terminal block nor the connected parts are directly stressed. • Make sure to observe the following precautions in order to prevent any damage to the machinery or accidents due to abnormal data written to the PLC under the influence of noise: 1) Do not bundle the main circuit line together with or lay it close to the main circuit, high-voltage line or load line. Otherwise, noise disturbance and/or surge induction are likely to take place. As a guideline, lay the control line at least 100 mm (3.94") or more away from the main circuit or high-voltage lines. 2) Ground the shield wire or shield of a shielded cable. Do not use common grounding with heavy electrical systems. • Place the communication cable in grounded metallic ducts or conduits both inside and outside of the control panel whenever possible.	29

4. STARTUP AND MAINTENANCE PRECAUTIONS

⚠WARNING	Reference
• Do not touch any terminal while the PLC's power is on. Doing so may cause electric shock or malfunctions. • Before cleaning or retightening terminals, cut off all phases of the power supply externally. Failure to do so may cause electric shock. • Before modifying or disrupting the program in operation or running the PLC, carefully read through this manual and the associated manuals and ensure the safety of the operation. An operation error may damage the machinery or cause accidents.	193 194 198 215

⚠CAUTION	Reference
• Do not disassemble or modify the PLC. Doing so may cause fire, equipment failures, or malfunctions. For repair, contact your local Mitsubishi Electric representative. • Turn off the power to the PLC before connecting or disconnecting any extension cable. Failure to do so may cause equipment failures or malfunctions. • Do not drop the product or exert strong impact to it. Doing so may cause damage. • Turn off the power to the PLC before attaching or detaching the following devices. Failure to do so may cause equipment failures or malfunctions. - Peripheral devices, display module, expansion boards, and special adapters - Input/output extension units/blocks, FX Series terminal blocks and special function units/blocks - Battery and memory cassette	194 198 215

5. DISPOSAL PRECAUTIONS

⚠CAUTION	Reference
• Please contact a certified electronic waste disposal company for the environmentally safe recycling and disposal of your device.	24

6. TRANSPORTATION AND STORAGE PRECAUTIONS

⚠CAUTION	Reference
• The PLC is a precision instrument. During transportation, avoid impacts larger than those specified in the general specifications of the PLC main unit manual by using dedicated packaging boxes and shock-absorbing palettes. Failure to do so may cause failures in the PLC. After transportation, verify operation of the PLC and check for damage of the mounting part, etc.	24

MEMO

FX3U-CAN

User's Manual

Manual number	JY997D43301
Manual revision	D
Date	8/2016

Foreword

This manual describes the FX3U-CAN Communication Block and should be read and understood before attempting to install or operate the hardware.
Store this manual in a safe place so that you can take it out and read it whenever necessary. Always forward it to the end user.

Outline Precautions

- This manual provides information for the use of the FX3U-CAN Communication block. The manual has been written to be used by trained and competent personnel. The definition of such a person or persons is as follows;
  1) Any engineer who is responsible for the planning, design and construction of automatic equipment using the product associated with this manual should be of a competent nature, trained and qualified to the local and national standards required to fulfill that role. These engineers should be fully aware of all aspects of safety with aspects regarding to automated equipment.
  2) Any commissioning or maintenance engineer must be of a competent nature, trained and qualified to the local and national standards required to fulfill the job. These engineers should also be trained in the use and maintenance of the completed product. This includes being familiar with all associated manuals and documentation for the product. All maintenance should be carried out in accordance with established safety practices.
  3) All operators of the completed equipment should be trained to use that product in a safe and coordinated manner in compliance with established safety practices. The operators should also be familiar with documentation that is connected with the actual operation of the completed equipment.

  Note: The term 'completed equipment' refers to a third party constructed device that contains or uses the product associated with this manual.

- This product has been manufactured as a general-purpose part for general industries, and has not been designed or manufactured to be incorporated in a device or system used in purposes related to human life.
- Before using the product for special purposes such as nuclear power, electric power, aerospace, medicine or passenger movement vehicles, consult with Mitsubishi Electric.
- This product has been manufactured under strict quality control. However when installing the product where major accidents or losses could occur if the product fails, install appropriate backup or failsafe functions into the system.
- When combining this product with other products, please confirm the standards and codes of regulation to which the user should follow. Moreover, please confirm the compatibility of this product with the system, machines, and apparatuses to be used.
- If there is doubt at any stage during installation of the product, always consult a professional electrical engineer who is qualified and trained in the local and national standards. If there is doubt about the operation or use, please consult your local Mitsubishi Electric representative.
- Since the examples within this manual, technical bulletin, catalog, etc. are used as reference; please use it after confirming the function and safety of the equipment and system. Mitsubishi Electric will not accept responsibility for actual use of the product based on these illustrative examples.
- The content, specification etc. of this manual may be changed for improvement without notice.
- The information in this manual has been carefully checked and is believed to be accurate; however, if you notice any doubtful point, error, etc., please contact your local Mitsubishi Electric representative.

Registration

- CiA® and CANopen® are registered Community Trademarks of CAN in Automation e.V.
- The company name and the product name to be described in this manual are the registered trademarks or trademarks of each company.

Standards

Certification of UL, cUL standards

FX3U-CAN units comply with the UL standards (UL, cUL).

UL, cUL File number :E95239

Regarding the standards that comply with the main unit, please refer to either the FX series product catalog or consult with your nearest Mitsubishi product provider.

Compliance with EC directive (CE Marking)

This document does not guarantee that a mechanical system including this product will comply with the following standards.
Compliance to EMC directive and LVD directive for the entire mechanical module should be checked by the user / manufacturer. For more information please consult with your nearest Mitsubishi product provider.
Regarding the standards that comply with the main unit, please refer to either the FX series product catalog or consult with your nearest Mitsubishi product provider.

Requirement for Compliance with EMC directive

The following products have shown compliance through direct testing (of the identified standards below) and design analysis (through the creation of a technical construction file) to the European Directive for Electromagnetic Compatibility (2014/30/EU) when used as directed by the appropriate documentation.

Attention
This product is designed for use in industrial applications.

Type: Programmable Controller (Open Type Equipment)
Models: MELSEC FX3U series manufactured
from April 1st, 2012 FX3U-CAN

Standard	Remark
EN61131-2:2007 Programmable controllers - Equipment requirements and tests	Compliance with all relevant aspects of the standard. **EMI** • Radiated Emission • Conducted Emission **EMS** • Radiated electromagnetic field • Fast transient burst • Electrostatic discharge • High-energy surge • Voltage drops and interruptions • Conducted RF • Power frequency magnetic field

Caution for Compliance with EC Directive

1) Caution for wiring
For noise prevention, please ground at least 35 mm (1.38") of the twisted-pair cable along the grounding plate to which the ground terminal is connected.

→ **For details regarding wiring, refer to Section 4.2**

2) Installation in Enclosure

→ **For details regarding installation in an enclosure of FX3G Series PLC, refer to FX3G User's Manual - Hardware Edition**

→ **For details regarding installation in an enclosure of FX3GC*1 Series PLC, refer to FX3GC User's Manual - Hardware Edition**

→ **For details regarding installation in an enclosure of FX3U Series PLC, refer to FX3U User's Manual - Hardware Edition**

→ **For details regarding installation in an enclosure of FX3UC*1 Series PLC, refer to FX3UC User's Manual - Hardware Edition**

→ **For details regarding installation in an enclosure of FX5U*2 PLC, refer to MELSEC iQ-F FX5U User's Manual (Hardware)**

→ **For details regarding installation in an enclosure of FX5UC*2 PLC, refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**

*1. An FX2NC-CNV-IF or FX3UC-1PS-5V is necessary to connect the FX3U-CAN to an FX3GC/FX3UC Series PLC.

*2. An FX5-CNV-BUS or FX5-CNV-BUSC is necessary to connect the FX3U-CAN to an FX5U/FX5UC PLC.

Associated Manuals

Only the installation manual is packed together with the FX3U-CAN Communication Block.
For a detailed explanation of the FX3U-CAN, refer to this manual.
For further information of the hardware information and instructions on the PLC main unit/CPU Module, refer to the respective manuals.

Manuals for FX3U-CAN Communication Block					
△	Supplied Manual	FX3U-CAN Installation Manual	JY997D43201	Describes some of FX3U-CAN communication block specifications for installation and wiring extracted from the FX3U-CAN User's Manual. For details, refer to FX3U-CAN User's Manual.	-
⊙	Additional Manual	FX3U-CAN User's Manual (This Manual)	JY997D43301	Describes details of the FX3U-CAN communication block.	-

Generic Names and Abbreviations Used in the Manual

Generic name or abbreviation	Description
PLC	
FX3G series	Generic name for FX3G Series PLC
FX3G PLC or main unit	Generic name for FX3G Series PLC main unit
FX3GC series	Generic name for FX3GC Series PLC
FX3GC PLC or main unit	Generic name for FX3GC Series PLC main unit
FX3U series	Generic name for FX3U Series PLC
FX3U PLC or main unit	Generic name for FX3U Series PLC main unit
FX3UC series	Generic name for FX3UC Series PLC
FX3UC PLC or main unit	Generic name for FX3UC Series PLC main unit
FX5U	Generic name for FX5U PLC
FX5U PLC or CPU module	Generic name for FX5U PLC CPU module
FX5UC	Generic name for FX5UC PLC
FX5UC PLC or CPU module	Generic name for FX5UC PLC CPU module
Expansion board	Generic name for expansion board The number of connectable units, however, depends on the type of main unit. To check the number of connectable units, refer to the User's Manual - Hardware Edition of the main unit to be used for your system.
Special adapter	Generic name for high-speed input/output special adapter, communication special adapter, analog special adapter, and CF card special adapter. The number of connectable units, however, depends on the type of main unit. To check the number of connectable units, refer to the User's Manual - Hardware Edition of the main unit to be used for your system.
I/O extension unit/block	Generic name for input/output powered extension unit and input/output extension block The number of connectable units, however, depends on the type of main unit. To check the number of connectable units, refer to the User's Manual - Hardware Edition of the main unit to be used for your system.
Special function unit/block or Special extension unit	Generic name for special function unit and special function block The number of connectable units, however, depends on the type of main unit. To check the number of connectable units, refer to the User's Manual - Hardware Edition of the main unit to be used for your system.
Special function unit	Generic name for special function unit
Special function block	Generic name for special function block
FX3U-CAN	Abbreviated name for FX3U-CAN
Memory cassette	Generic name for memory cassette. The number of connectable units, however, depends on the type of main unit. To check the number of connectable units, refer to the User's Manual - Hardware Edition of the main unit to be used for your system.
FX Series terminal block	Generic name for FX Series terminal block. The number of connectable units, however, depends on the type of main unit. To check the number of connectable units, refer to the User's Manual - Hardware Edition of the main unit to be used for your system.
Peripheral unit	
Peripheral unit	Generic name for programming software, handy programming panel, and indicator
Programming tool	
Programming tool	Generic name for programming software and handy programming panel
Programming software	Generic name for programming software
GX Works2	Abbreviation of programming software packages SW□DNC-GXW2-J/SW□DNC-GXW2-E
GX Developer	Abbreviation of programming software packages SW□D5C-GPPW-J/SW□D5C-GPPW-E
Handy programming panel (HPP)	Generic name for FX-30P and FX-20P(-E)

Generic name or abbreviation	Description
Indicator	
GOT1000 series	Generic name for GT15, GT11 and GT10
GOT-900 series	Generic name for GOT-A900 series and GOT-F900 series
GOT-A900 series	Generic name for GOT-A900 series
GOT-F900 series	Generic name for GOT-F900 series
ET-940 series	Generic name for ET-940 series
Manual	
FX3G Hardware Edition	Abbreviation of FX3G Series User's Manual - Hardware Edition
FX3GC Hardware Edition	Abbreviation of FX3GC Series User's Manual - Hardware Edition
FX3U Hardware Edition	Abbreviation of FX3U Series User's Manual - Hardware Edition
FX3UC Hardware Edition	Abbreviation of FX3UC Series User's Manual - Hardware Edition
Programming manual	Generic name for FX3S/FX3G/FX3GC/FX3U/FX3UC Series Programming Manual - Basic and Applied Instruction Edition, MELSEC iQ-F FX5 Programming Manual (Program Design), and MELSEC iQ-F FX5 Programming Manual (Instructions, Standard Functions/Function Blocks)
Communication control Edition	Abbreviation of FX Series User's Manual - Data Communication Edition
Analog control Edition	Abbreviation of FX3S/FX3G/FX3GC/FX3U/FX3UC Series User's Manual - Analog Control Edition
Positioning control Edition	Abbreviation of FX3S/FX3G/FX3GC/FX3U/FX3UC Series User's Manual - Positioning Control Edition
CANopen® communication term	
U8, U16, U32, U48	Unsigned Integer x Bit
I8, I16, I32	Signed Integer x Bit
Visible String	String of ISO646 bit coded characters which end after the last character.
Domain	Large block of binary data.
CAN	Controller Area Network
CANopen®	CAN based higher-layer protocol
CAN-ID	CAN Identifier Identifier for CAN data and remote frames as defined in ISO11898-1
CiA®	CAN in Automation Non-profit organization for standardization of CAN protocols. The CiA® Members develop specifications which are published as CiA® specifications. (http://can-cia.org/)
COB-ID	Communication object identifier Identifier that contains the CAN-ID and additional control bits.
RPDO	Receive Process Data Objects are data received from other nodes via the CAN bus.
TPDO	Transmit Process Data Objects are data sent to other nodes via the CAN bus.
MPDO	Multiplexed Process Data Object
SDO	Service Data Object
SYNC	Synchronization object
EMCY	Emergency object
NMT	Network management
LSS	Layer Setting Services
OSC	Open Style Connector
RTR	Remote transmission request
VD	Virtual Device

1. Introduction

1.1 Outline

The FX3U-CAN communication block is an interface block that allows FX3G/FX3GC/FX3U/FX3UC/FX5U/FX5UC PLCs to connect to a CANopen® system. FX3U-CAN can be connected directly to the FX3G/FX3GC*1/FX3U/FX3UC*1/FX5U*2/FX5UC*2 PLC's extension port, or to any other extension unit / block's right side extension port.

*1. An FX2NC-CNV-IF or FX3UC-1PS-5V is necessary to connect the FX3U-CAN to an FX3GC/FX3UC Series PLC.

*2. An FX5-CNV-BUS or FX5-CNV-BUSC is necessary to connect the FX3U-CAN to an FX5U/FX5UC PLC.

For safe use ⚠CAUTION

- This product has been manufactured as a general-purpose part for general industries, and has not been designed or manufactured to be incorporated in a device or system used in purposes related to human life.
- Before using the product for special purposes such as nuclear power, electric power, aerospace, medicine or passenger movement vehicles, consult with Mitsubishi Electric.
- This product has been manufactured under strict quality control. However when installing the product where major accidents or losses could occur if the product fails, install appropriate backup or failsafe functions in the system.

1.1.1 Overview of the CANopen® Network

CANopen® is a CAN based higher layer protocol which provides a very flexible system for transferring serial messages between different nodes via the CAN bus.

1) Simple, relatively high speed communication can be accomplished with modules that handle binary data such as I/Os or numeric data.
2) All CANopen® nodes are able to transmit data and several nodes can make a request to the CAN bus simultaneously.
3) Messages can be prioritized for transfer to the CAN Bus.

1.1.2 Overview of FX3U-CAN communication block

CANopen® ready I/O stations and device stations can be connected to the CAN bus and information can be transmitted to the FX3U-CAN communication block and FX3G/FX3GC/FX3U/FX3UC/FX5U/FX5UC PLC.

1. The maximum send / receive message number

80 TPDO /80 RPDO (8 bytes / PDO) can be sent and received to/from a CANopen® network.

2. CANopen® device/application Profiles according to CiA® Standards

- Interface and Device Profile CiA® 405 V2.0 for IEC 61131-3 Programmable Devices.
- Application Profile CiA® 417 V2.1 for lift control systems.

3. Communication with other CANopen® nodes

All nodes on the CANopen® network can write data to all the other nodes on the network. Each piece of data has a unique identifying number that is read by the receiving nodes to determine whether that data should be kept in the receiving nodes' Buffer Memory.
The FX3U-CAN communication block uses buffer memories to communicate on the CAN bus. Each buffer memory is separated into memory dedicated to write TO and memory dedicated to read FROM the CAN bus. These Buffer Memories are accessed by FROM/TO commands of the PLC. However, only FX3U/FX3UC/FX5U/FX5UC PLC supports direct specification of the buffer memory.
For further information on applied instructions, bit specification of word devices and direct specification of buffer memory, refer to the following manual.

→ **Refer to PROGRAMMING MANUAL**

Note

Buffer memory that is assigned in 32 bits must use 32-bit instructions to read/write.
32-bit data cannot be correctly read/written from/to buffer memory if 16-bit read/write instructions are used.

1.1.3 Characteristics

This section describes the characteristics of the CAN bus, communication with other CANopen® nodes, and some of the special features available in the CANopen® protocol.

1. The object dictionary

The Object Dictionary is a type of indexed storage system that contains data, device parameters, CANopen® feature setup data, instruction triggers, and other information necessary to configure and operate the CANopen® protocol.

2. SDO command

The Service Data Object Command can be used to read/write data to the Object Dictionary.
This command can be used to set network parameters and also to initiate CANopen® functionality.

3. SYNC service

The SYNC service provides the basic network synchronization mechanism.

4. TIME service

The TIME service provides a simple network clock. CANopen® devices that operate a local clock may use the TIME object to adjust their own time base to that of the time stamp object producer.

5. EMCY object service

Emergency objects are triggered by the occurrence of a CANopen® device internal error situation and are transmitted from an emergency producer on the CANopen® device.

6. **Network management (hereinafter called NMT)**
   - General NMT services
   - Node guarding Master/Slave
   - Heartbeat Consumer/Producer

7. **The command interface**
   The Command Interface (CIF) can be used to access the Object Dictionary of the local node or a network node and is located in the BFM. Access is performed by commands for SDO read/write, special direct command for Node Guarding, Heartbeat, PDO Mapping or Emergency Messages.

8. **NMT master**
   The network management provides services for controlling the network behaviour of CANopen® devices as defined in CiA® 301 and CiA® 302. All CANopen® devices of a network referred to as NMT slaves are controlled by services provided by an NMT master.

9. **Flying master**
   The flying master mechanism provides services for a hot stand-by NMT master within a CANopen® network.

10. **Configuration manager**
    The Configuration manager provides mechanisms for configuration of CANopen® devices in a CANopen® network.

11. **SYNC producer**
    The SYNC producer broadcasts the SYNC object. The SYNC service provides the basic network synchronization mechanism.

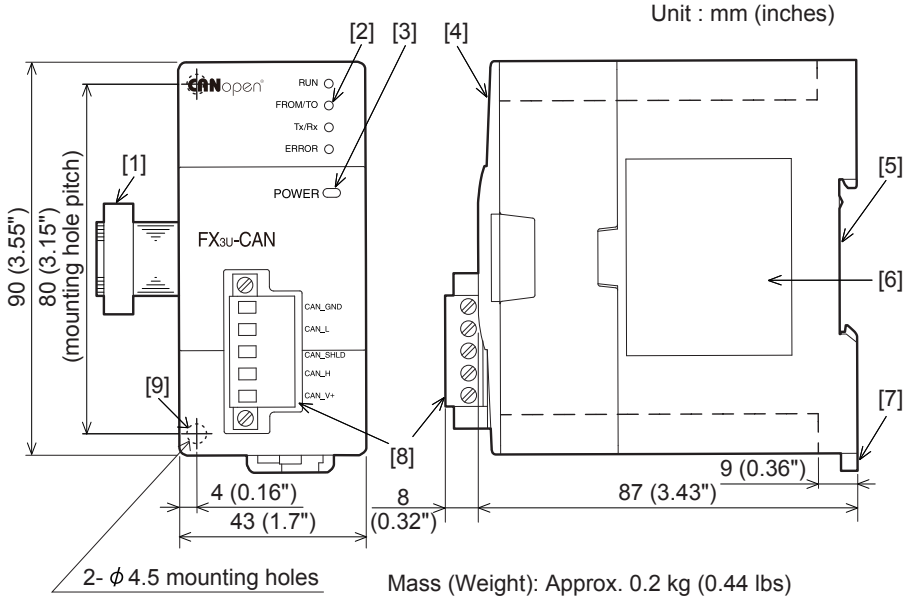
12. **Layer setting services master (hereinafter called LSS) according to standard CiA® 305 V2.2**
    With this service, an LSS slave device that is sealed against harsh environments and that does not have any hardware components like DIP-switches for setting the node-ID or bit timing parameters can be configured via the CAN Bus.

13. **MPDO for Lift Application Profile**
    An MPDO provides direct write access to objects of a CANopen device's object dictionary.
    The size of the data of these objects is limited to a maximum of 4 bytes.

1.2 External Dimensions and Each Part Name

1.2.1 External dimensions and each part name

Unit : mm (inches)



Mass (Weight): Approx. 0.2 kg (0.44 lbs)

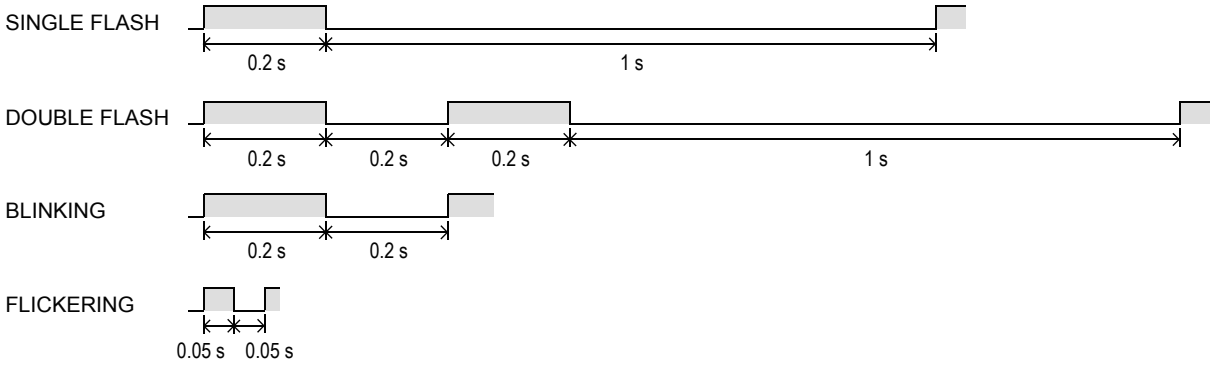
Accessories: Label for indication of special function unit/block number,
Dust proof protection sheet,
Terminating resistor (120Ω 1/2W),
Manual supplied with product

[1]	Extension cable	[6]	Nameplate
[2]	Status LEDs (See Subsection 1.2.2)	[7]	DIN rail mounting hook
[3]	Power LED (See Subsection 1.2.2)	[8]	CAN bus connector
[4]	Top cover	[9]	Direct mounting hole 2 holes of ϕ4.5 (0.18") (mounting screw: M4 screw)
[5]	DIN rail mounting groove DIN rail: DIN46277, 35 mm (1.38") width		

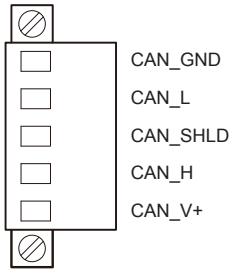
1.2.2 Power and status LEDs

LED Name	LED Color	Status	Description
RUN	Green	OFF	Layer 2 offline mode
		SINGLE FLASH*1	CANopen® STOPPED state
		BLINKING*1	CANopen® PRE-OPERATIONAL state
		FLICKERING*1	LSS Services in progress
		ON	• CANopen® mode: CANopen® OPERATIONAL state • Layer 2 mode: Layer 2 online mode
FROM/TO	Green	OFF	PLC is not accessing BFMs in module.
		ON	PLC is accessing BFMs in module.
Tx/Rx	Green	OFF	Module is not transmitting or receiving CAN messages.
		ON	Module is transmitting or receiving CAN messages.
ERROR	Red	OFF	No error
		SINGLE FLASH*1	At least one of the error counters of the module has reached or exceeded the error passive level.
		DOUBLE FLASH*1	A NMT guarding failure (NMT-Slave or NMT-Master) or a heartbeat failure has occurred.
		BLINKING*1	General error
		FLICKERING*1	LSS Services in progress
		ON	Module is BUS-OFF state, or CPU error occurs in PLC main unit.
POWER	Green	ON	24V DC power is properly supplied from PLC main unit.

*1. RUN and ERROR LEDs have four kinds of flicker states: single flash, double flash, blinking, and flickering.
This LED flickers as follows.



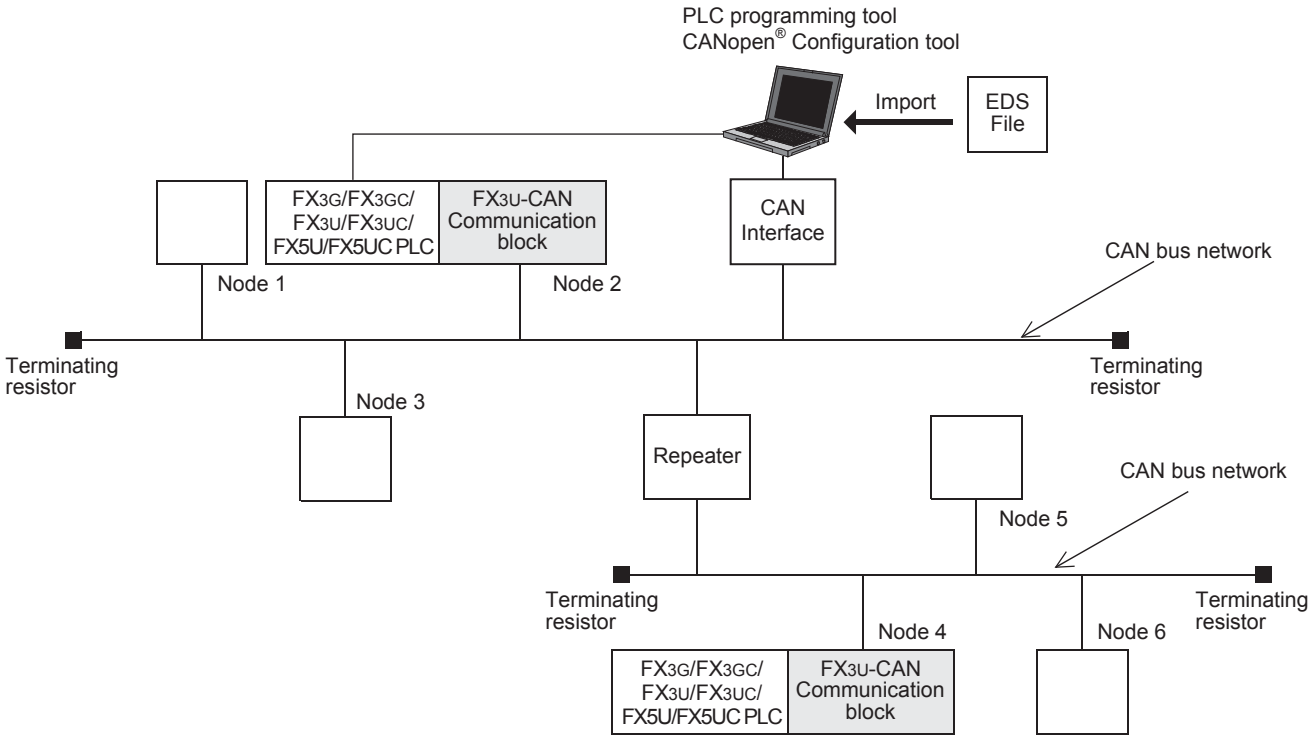
1.2.3 Terminal layout



Pin No.	Signal	Description
1	CAN_GND	Ground / 0 V / V-
2	CAN_L	CAN_L bus line (dominant low)
3	(CAN_SHLD)	Optional CAN shield
4	CAN_H	CAN_H bus line (dominant high)
5	(CAN_V+)	Optional CAN external positive supply (not connected internally)

1.3 System Configuration

1.3.1 General configuration



Part Name	Model Name	Remarks
Communication block	FX3U-CAN	
PLC	FX3G/FX3GC/FX3U/ FX3UC /FX5U/FX5UC PLC	An FX2NC-CNV-IF or FX3UC-1PS-5V is necessary to connect the FX3U-CAN to an FX3GC/FX3UC Series PLC. An FX5-CNV-BUS or FX5-CNV-BUSC is necessary to connect the FX3U-CAN to an FX5U/FX5UC PLC.
CAN bus network	-	CAN bus network
Node	-	CANopen® Node, or CAN Layer 2 Node
Repeater	-	
CANopen® Configuration tool	-	
PLC programming tool	GX Works2	
EDS file (Electronic Data Sheet file)	FX3U-CAN-405.eds, FX3U-CAN-417.eds	FX3U-CAN-405: When using FX3U-CAN by Interface and Device Profile CiA® 405 for IEC 61131-3 Programmable Devices, the EDS file uses FX3U-CAN-405.eds. FX3U-CAN-417: When using FX3U-CAN by Application Profile CiA® 417 for lift control systems, the EDS file uses FX3U-CAN-417.eds.
CAN Interface	-	Hardware Interface between CANopen® Configuration tool and CAN bus.
Terminating resistor	-	The CAN bus network requires terminating resistors for network both ends.
Maximum transmission distance	-	5000 m (16,404'2") at 10 kbps (with repeaters). The transmission distance is reduced to 25 m (82') at the maximum baud rate of 1 Mbps. The maximum distance also depends on the specification of other connected nodes.

How to obtain EDS file

For EDS file, consult with your local Mitsubishi Electric representative.

1.3.2 Applicable PLC

Model name	Applicability
FX3G Series PLC	Ver. 1.00 and later (Up to 8 blocks can be extended*2)
FX3GC Series PLC*1	Ver. 1.40 and later (Up to 8 blocks can be extended*2)
FX3U Series PLC	Ver. 2.20 and later (Up to 8 blocks can be extended*2)
FX3UC Series PLC*1	Ver. 2.20 and later (Up to 8 blocks can be extended*2*3)
FX5U PLC*4*5	Ver. 1.031 and later (Up to 8 blocks can be extended*2)
FX5UC PLC*4*5	Ver. 1.031 and later (Up to 8 blocks can be extended*2)

The version number can be checked by reading the last three digits of device D8001/D8101.

*1. An FX2NC-CNV-IF or FX3UC-1PS-5V is necessary to connect the FX3U-CAN to an FX3GC/FX3UC PLC.

*2. Check the current consumption of the connected extension blocks and when necessary insert extension power supply units.

*3. Up to 7 units can be connected to the FX3UC-32MT-LT(-2) PLC.

*4. An FX5-CNV-BUS or FX5-CNV-BUSC is necessary to connect the FX3U-CAN to an FX5U/FX5UC PLC.

*5. Applicable for FX3U-CAN firmware Ver. 1.12 and later.

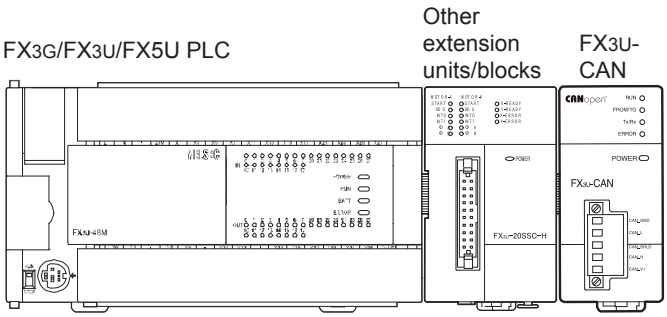
1.3.3 Connection with PLC

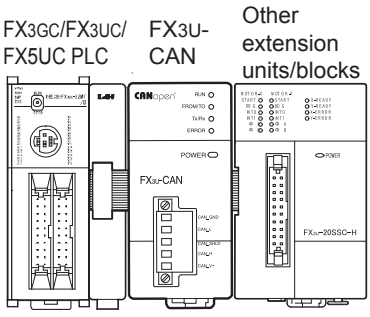
The FX3U-CAN connects with a PLC via an extension cable.
The FX3U-CAN is handled as a special extension block of the PLC. The unit number of the FX3U-CAN is automatically assigned No. 0 to No. 7[*1*2] starting from the special function unit/block closest to the PLC main unit/CPU Module.
(This unit number is used for the designation of a FROM/TO instruction.)
For further information of the assignment of the I/O number and unit number of the PLC, refer to the following manual corresponding to the connected PLC.

*1. Unit No. 1 to No. 7 is assigned when the main unit is an FX3UC-32MT-LT(-2).

*2. Unit No. 2 to No. 16 is assigned when the CPU module is an FX5U/FX5UC.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**



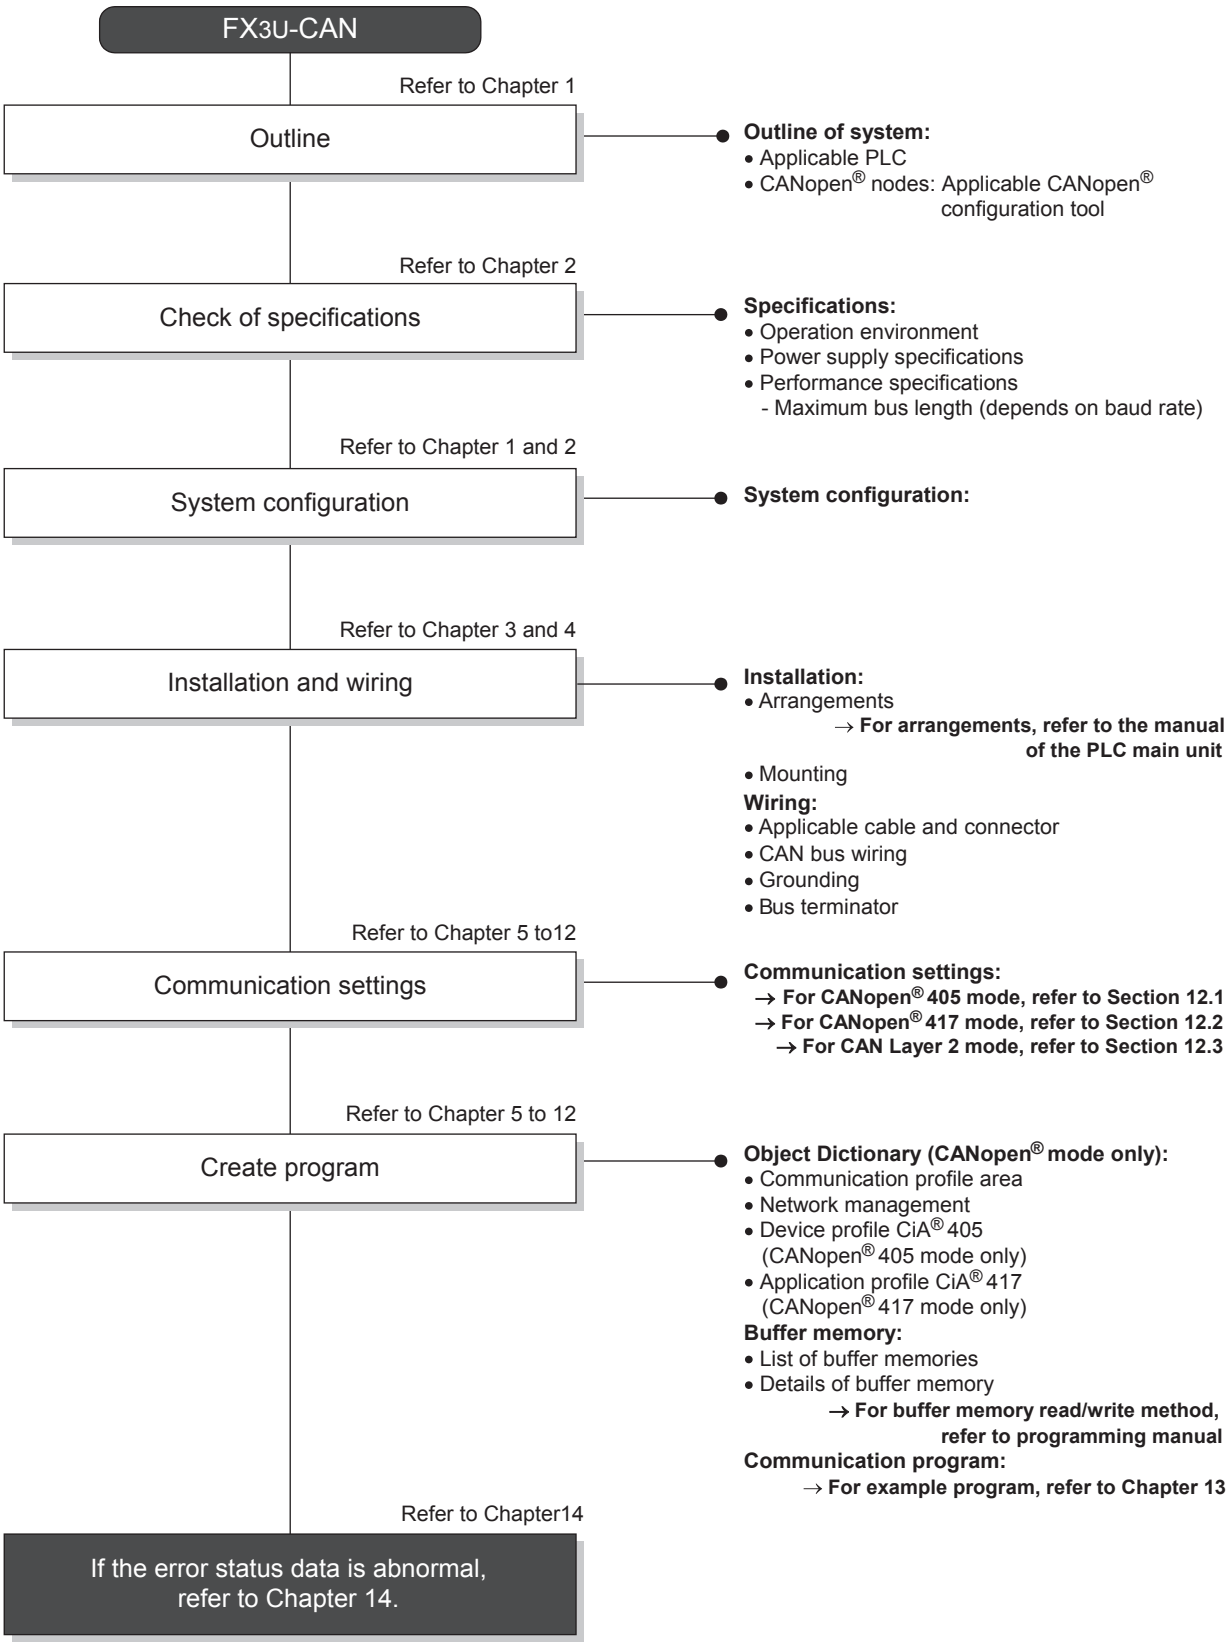


FX2NC-CNV-IF

- An FX2NC-CNV-IF or FX3UC-1PS-5V is necessary to connect the FX3U-CAN to an FX3GC/FX3UC PLC.
- An FX5-CNV-BUS or FX5-CNV-BUSC is necessary to connect the FX3U-CAN to an FX5U/FX5UC PLC.
- The optional FX0N-65EC (FX0N-30EC) and FX2N-CNV-BC are necessary to lengthen the extension cable. (FX3G/FX3GC/FX3U/FX3UC PLC)
- The optional FX5-65EC (FX5-30EC) and FX5-CNV-BC are necessary to lengthen the extension cable. (FX5U/FX5UC PLC)
- The number of I/O points occupied by the FX3U-CAN is eight. Make sure that the total number of I/O points (occupied I/O points) of the main unit, extension unit(s), extension block(s) and the number of points occupied by special function blocks does not exceed the maximum number of I/O points of the PLC.
  For further information of the maximum number of I/O points of the PLC, refer to the respective product manual.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**

1.4 System Start-up Procedure



2. Specifications

DESIGN PRECAUTIONS ⚠WARNING

- Make sure to have the following safety circuits outside of the PLC to ensure safe system operation even during external power supply problems or PLC failure.
  Otherwise, malfunctions may cause serious accidents.
  1) Most importantly, have the following: an emergency stop circuit, a protection circuit, an interlock circuit for opposite movements (such as normal vs. reverse rotation), and an interlock circuit (to prevent damage to the equipment at the upper and lower positioning limits).
  2) Note that when the PLC CPU detects an error, such as a watchdog timer error, during self-diagnosis, all outputs are turned off. Also, when an error that cannot be detected by the PLC CPU occurs in an input/output control block, output control may be disabled.
     External circuits and mechanisms should be designed to ensure safe machinery operation in such a case.
- For the operating status of each node in the case of a communication error, see the FX3U-CAN user's manual and the product manual of each node.
  Erroneous output or malfunctions may cause an accident.
- When executing control (data changes) to an operating PLC, construct an interlock circuit in the sequence program so that the entire system operates safely. In addition, when executing control such as program changes and operation status changes (status control) to an operating PLC, carefully read the manual and sufficiently confirm safety in advance. Especially in control from external equipment to a PLC in a remote place, problems in the PLC may not be able to be handled promptly due to abnormality in data transfer. Construct an interlock circuit in the sequence program. At the same time, determine the actions in the system between the external equipment and the PLC for protection against abnormalities in data transfer.

DESIGN PRECAUTIONS ⚠CAUTION

- Make sure to observe the following precautions in order to prevent any damage to the machinery or accidents due to abnormal data written to the PLC under the influence of noise:
  1) Do not bundle the main circuit line together with or lay it close to the main circuit, high-voltage line or load line.
     Otherwise, noise disturbance and/or surge induction are likely to take place. As a guideline, lay the control line at least 100mm (3.94") or more away from the main circuit or high-voltage lines.
  2) Ground the shield wire or shield of a shielded cable.
     Do not use common grounding with heavy electrical systems (refer to the manual of the PLC main unit).

DISPOSAL PRECAUTIONS ⚠CAUTION

- Please contact a certified electronic waste disposal company for the environmentally safe recycling and disposal of your device.

TRANSPORTATION AND STORAGE PRECAUTIONS ⚠CAUTION

- The PLC is a precision instrument. During transportation, avoid impacts larger than those specified in the general specifications of the PLC main unit manual by using dedicated packaging boxes and shock-absorbing palettes.
  Failure to do so may cause failures in the PLC. After transportation, verify operation of the PLC and check for damage of the mounting part, etc.

2.1 General Specifications

Items other than the following table are equivalent to those of the PLC main unit/CPU Module.
For further information of general specifications, refer to the manual of the PLC main unit/CPU Module.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**

Item	Specification	
Dielectric Withstand Voltage	500V AC for one minute	Between all terminals and ground terminal
Insulation Resistance	5MΩ or higher by 500V DC insulation resistance tester	

2.2 Power Supply Specifications

Item	Specification
Internal Power Supply	24V DC, max 110 mA 24V DC power is supplied internally from the main unit.

For details on the 24V DC power supply of main unit, refer to the manual of the PLC main unit.

2.3 Performance Specifications

Item	Specification
Transmission Type	CAN Bus network (RS-485, CSMA/CR)
Applicable Function	CANopen® Node, CAN Layer 2 Node
CANopen® Communication Services According to CiA® Standards	CiA® 301 V4.2 CiA® 302 V4.1 CiA® 305 V2.2
CANopen® Device and Application Profiles According to CiA® Standards	• Interface and Device Profile CiA® 405 V2.0 for IEC 61131-3 Programmable Devices. • Application Profile CiA® 417 V2.1 for lift control systems.
Remote Transmit Request (RTR)	No support in CANopen® mode. Support in Layer 2 mode. → **For support in Layer 2 mode, refer to Chapter 9**
Node Number on CANopen® Network	Maximum 127 nodes A total of 30 nodes can be connected to any segment of the bus. Using repeaters or bridges, the total number can be extended up to 127 nodes.
Node ID	Selectable from 1 to 127
Communication Method	Acyclic, cyclic or event driven
Supported Transmission Speed / Maximum Bus Length	1 Mbps / 25 m (82')
	800 kbps / 50 m (164')
	500 kbps / 100 m (328'1")
	250 kbps / 250 m (820'2")
	125 kbps / 500 m (1640'5")
	100 kbps / 600 m (1968'6")
	50 kbps / 1000 m (3280'10")
	20 kbps / 2500 m (8202'1")
	10 kbps / 5000 m (16404'2")
Connection Cable	Refer to Subsection 4.1.2.
Terminating Resistor	120 Ω (Accessory: 120 Ω 1/2W)
No. of Occupied I/O Points	8 points (taken from either the input or output points of the PLC)

3. Installation

INSTALLATION PRECAUTIONS **⚠WARNING**

- Make sure to cut off all phases of the power supply externally before attempting installation or wiring work.
  Failure to do so may cause electric shock or damage to the product.

INSTALLATION PRECAUTIONS **⚠CAUTION**

- Use the product within the generic environment specifications described in PLC main unit manual (Hardware Edition).
  Never use the product in areas with excessive dust, oily smoke, conductive dusts, corrosive gas (salt air, Cl2, H2S, SO2 or NO2), flammable gas,
  vibration or impacts, or expose it to high temperature, condensation, or rain and wind.
  If the product is used in such conditions, electric shock, fire, malfunctions, deterioration or damage may occur.
- Do not touch the conductive parts of the product directly.
  Doing so may cause device failures or malfunctions.
- When drilling screw holes or wiring, make sure that cutting and wiring debris do not enter the ventilation slits.
  Failure to do so may cause fire, equipment failures or malfunctions.
- Be sure to remove the dust proof sheet from the PLC's ventilation port when installation work is completed.
  Failure to do so may cause fire, equipment failures or malfunctions.
- Install the product on a flat surface.
  If the mounting surface is rough, undue force will be applied to the PC board, thereby causing nonconformities.
- Install the product securely using a DIN rail or mounting screws.
- Connect extension cables securely to their designated connectors.
  Loose connections may cause malfunctions.

3.1 Connection with PLC

The FX3U-CAN connects on the right side of a PLC main unit/CPU Module or extension units/blocks (including special function units/blocks).
For connection to an FX3GC/FX3UC Series PLC or FX2NC Series PLC extension block, an FX2NC-CNV-IF or FX3UC-1PS-5V is required.
For connection to an FX5U/FX5UC PLC, an FX5-CNV-BUS or FX5-CNV-BUSC is required.
For further information, refer to the respective PLC manual.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**

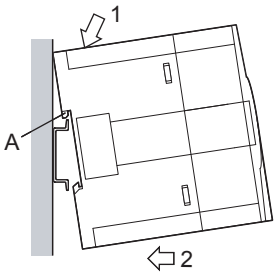
3.2 Mounting

The FX3U-CAN may be installed in a control cabinet with a 35 mm wide DIN46277 DIN rail mounting or M4 screw direct mounting.

3.2.1 DIN rail mounting

The product may be mounted on a 35 mm wide DIN46277 (DIN rail).

1 **Fit the upper edge (A in the figure to the right) of the DIN rail mounting groove onto the DIN rail.**



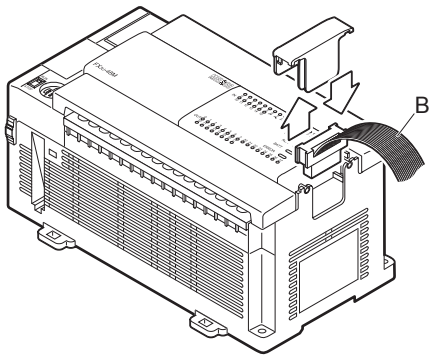
2 **Push the product onto the DIN rail.**

- An interval space of 1 to 2 mm (0.04" to 0.08") between each unit is necessary.

3 **Connect the extension cable.**

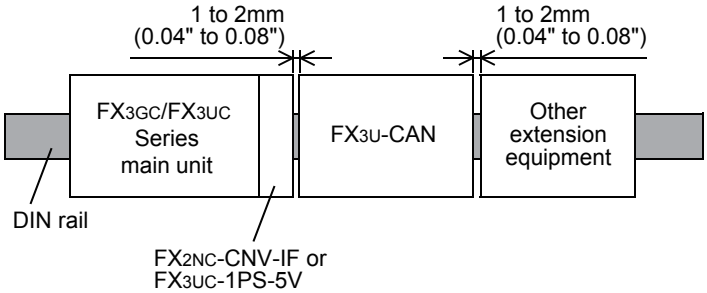
Connect the extension cable (B in the figure to the right) to the main unit, I/O extension unit/block or special function unit/block on the left side of the product.
For further information of the extension cable connection procedure, refer to the respective product PLC manual.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**



- Example of installation on DIN rail
  - In the case of the FX3G/FX3U PLC

  - In the case of the FX3GC/FX3UC PLC



3.2.2 Direct Mounting

The product can be installed directly with screws.
An interval space of 1 to 2 mm (0.04" to 0.08") between each unit is necessary.
For further information of installation, refer to the following respective PLC manual.

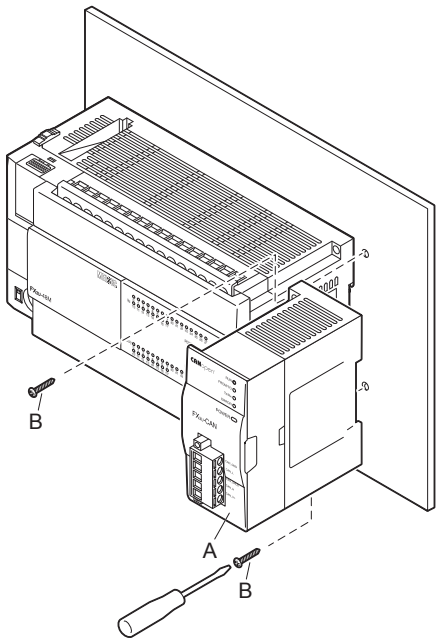
→ **For mounting hole pitches, refer to Section 1.2**
→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**

1 **Create mounting holes in the mounting surface according to the external dimensions diagram.**

2 **Fit the FX3U-CAN (A in the figure to the right) to the mounting holes and tighten with M4 screws (B in the figure to the right).**

For further information of the screw position and quantity, refer to the dimensioned drawing specified below.

→ **For dimensions, refer to Section 1.2**

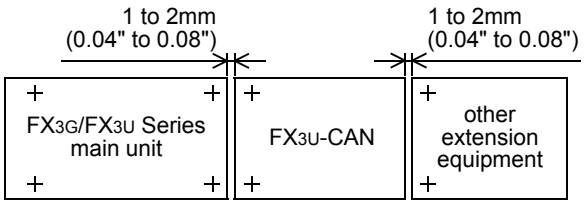


3 **Connect the extension cable.**

Connect the extension cable to the main unit, I/O extension unit/block or special function unit/block on the left side of the product.
(Refer to Step 3 in Subsection 3.2.1.)
For further information of the extension cable connection procedure, refer to the respective PLC manual.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**

- Example of direct installation



(+ shows the M4 screw)

4. Wiring

WIRING PRECAUTIONS **⚠WARNING**

- Make sure to cut off all phases of the power supply externally before attempting installation or wiring work.
  Failure to do so may cause electric shock or damage to the product.

WIRING PRECAUTIONS **⚠CAUTION**

- Perform class D grounding (grounding resistance: 100Ω or less) to the shield of the twisted shield cable (refer to Subsection 4.2.3).
  Do not use common grounding with heavy electrical systems.
- When drilling screw holes or wiring, make sure cutting or wire debris does not enter the ventilation slits.
  Failure to do so may cause fire, equipment failures or malfunctions.
- Install module so that excessive force will not be applied to communication connectors or communication cables.
  Failure to do so may result in wire damage/breakage or PLC failure.
- Make sure to affix the CAN bus connector with fixing screws.
  Tightening torque should follow the specifications in the manual.
  Loose connections may cause malfunctions.
- Make sure to properly wire to the terminal block (CAN bus connector) in accordance with the following precautions.
  Failure to do so may cause electric shock, equipment failures, a short-circuit, wire breakage, malfunctions, or damage to the product.
  - The disposal size of the cable end should follow the dimensions described in the manual.
  - Tightening torque should follow the specifications in the manual.
  - Twist the end of strand wire and make sure that there are no loose wires.
  - Do not solder-plate the electric wire ends.
  - Do not connect more than the specified number of wires or electric wires of unspecified size.
  - Affix the electric wires so that neither the terminal block nor the connected parts are directly stressed.
- Make sure to observe the following precautions in order to prevent any damage to the machinery or accidents due to abnormal data written to the PLC under the influence of noise:
  1) Do not bundle the main circuit line together with or lay it close to the main circuit, high-voltage line or load line.
     Otherwise, noise disturbance and/or surge induction are likely to take place. As a guideline, lay the control line at least 100 mm (3.94") or more away from the main circuit or high-voltage lines.
  2) Ground the shield wire or shield of a shielded cable.
     Do not use common grounding with heavy electrical systems.
- Place the communication cable in grounded metallic ducts or conduits both inside and outside of the control panel whenever possible.

4.1 Applicable Cable and Connector

4.1.1 Applicable connector

FX3U-CAN uses a CAN bus connector. This connector is removable.
For further information of removal and installation of the CAN bus connector, refer to the following section.

→ **Refer to Subsection 4.1.4**

4.1.2 Applicable cable

Item	Applicable Cable
Cable Type	Twisted pair cable
Unshielded/ Shielded	Shielded
No. of Pairs	2 pair
Conformance Standard	ISO 11898/1993
Wire Size	0.3 mm^2 to 0.82 mm^2 (AWG22 to 18)
Impedance	120 Ω

Note

The bus length, length related resistance and the cross section of the cable to be used should be related as follows.

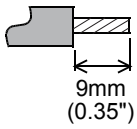
Guidelines for the cable are available in CiA® 303.

→ **For details, refer to CiA® 303**

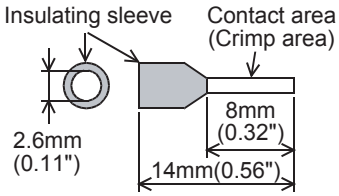
Bus Length (m)	Length Related Resistance (mΩ/m)	Cross Section (mm^2)
0 to 40	70	0.3 to 0.34 (AWG 22)
40 to 300	Less than 60	0.34 to 0.60 (AWG 22 to 19)
300 to 600	Less than 40	0.50 to 0.60 (AWG 20 to 19)
600 to 1000	Less than 26	0.75 to 0.80 (AWG 18)

4.1.3 Termination of cable end

Strip 9 mm (0.35") of insulation from the end of the wire. For stranded wires, terminate the end of the wire using a wire ferrule with insulating sleeve.
Tighten the terminals to a torque of 0.4 to 0.5 N•m.
Do not tighten terminal screws with a torque outside the above-mentioned range. Failure to do so may cause equipment failures or malfunctions.



- When using stranded wires
  It may be difficult to insert the electric wire into the insulating sleeve depending on the thickness of the electric wire sheath. Select appropriate electric wire by referring to the dimensions of the wire ferrule.
  <Reference>



Manufacturer	Model names	Caulking tool
Phoenix Contact	AI 0.5-8WH	CRIMPFOX 6*1
	AI-TWIN 2X 0.5-8WH	(or CRIMPFOX 6T-F*2)

*1. Old model name : CRIMPFOX ZA 3

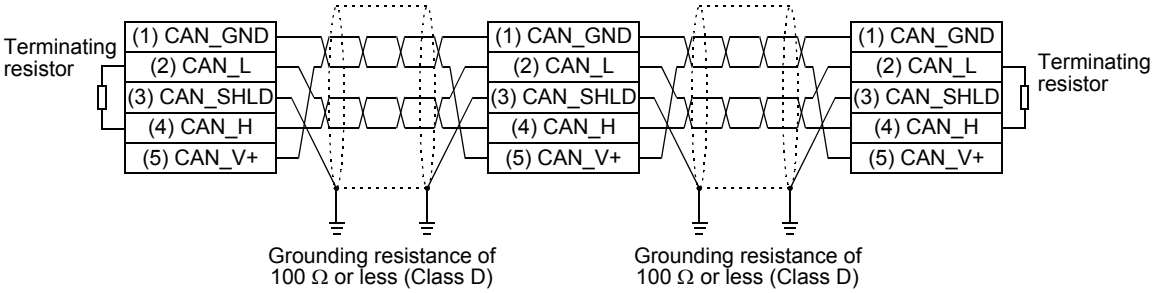
*2. Old model name : CRIMPFOX UD 6

4.1.4 Removal and installation of CAN bus connector

1) Removal
   Evenly unscrew both CAN connector mounting screws, and remove the CAN connector from the module.
   If the cable is attached to the connector, hold and pull the connector on the side. Do not pull the cable.
2) Installation
   Place the CAN connector in the specified position, and evenly tighten both CAN connector mounting screws.
   Tightening torque 0.4 to 0.5 N•m
   Do not tighten the terminal block mounting screws with a torque outside the above-mentioned range.
   Failure to do so may cause equipment failures or malfunctions.

4.2 CAN-Bus Wiring

4.2.1 Connecting communication cables



For electromagnetic compatibility (EMC), it is recommended to ground the cable shield at both ends.

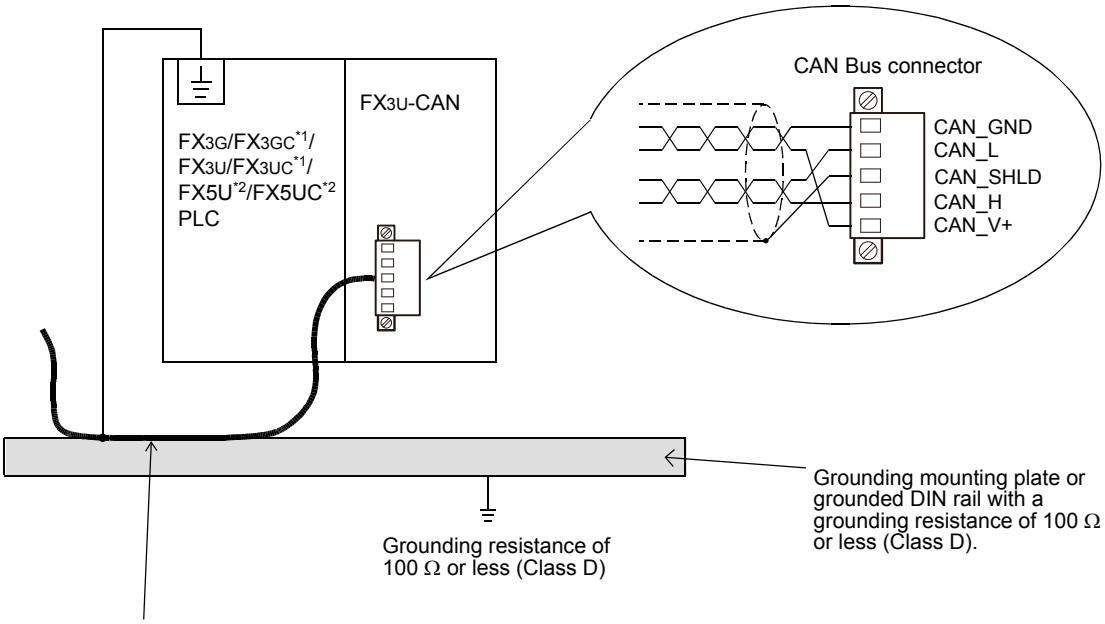
Caution

For safety, always check the potential differences between the grounding points. If potential differences are found, proper measures must be taken to avoid damage.

4.2.2 Module wiring

For further information on PLC wiring, refer to the following manual.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**



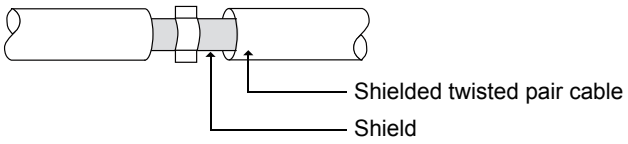
Strip a part of the coating of the shielded twisted pair cable as shown in subsection 4.2.3.
Ground the PLC's grounding terminal there.

*1. An FX2NC-CNV-IF or FX3UC-1PS-5V is necessary to connect the FX3U-CAN to an FX3GC/FX3UC Series PLC.

*2. An FX5-CNV-BUS or FX5-CNV-BUSC is necessary to connect the FX3U-CAN to an FX5U/FX5UC PLC.

4.2.3 Grounding of twisted pair cable

Strip a part of the coating of the shielded twisted pair cable as shown below, and ground at least 35 mm (1.38") of the exposed shield section.



4.2.4 Termination

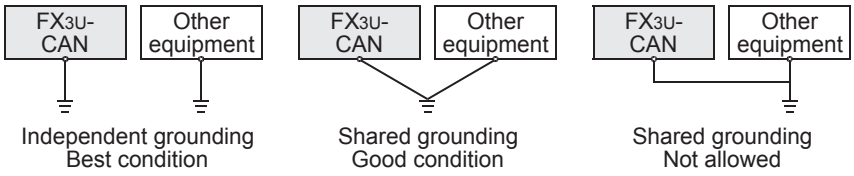
The CANopen® network requires terminating resistors for both network ends. When FX3U-CAN is the network end, connect the included terminating resistor (120 Ω 1/2W) between pin number 2 (CAN_L) and 4 (CAN_H).

4.3 Grounding

Ground the cables as follows

- The grounding resistance should be 100 Ω or less.
- Independent grounding should be established whenever possible.
  Independent grounding should be performed for best results.
  When independent grounding is not configured, perform "shared grounding" as shown in the following figure.
  For further information, refer to the respective PLC manual.

→ **Refer to FX3G Hardware Edition**
→ **Refer to FX3GC Hardware Edition**
→ **Refer to FX3U Hardware Edition**
→ **Refer to FX3UC Hardware Edition**
→ **Refer to MELSEC iQ-F FX5U User's Manual (Hardware)**
→ **Refer to MELSEC iQ-F FX5UC User's Manual (Hardware)**



- The grounding point should be close to the FX3U-CAN, and all grounding wires should be as short as possible.

5. Introduction of Functions

5.1 Functions List

The function list is shown below.

Functions	Description	Reference
Function Modes	Different Function Modes of the module	Section 5.2 and Section 6.5
Object Dictionary	Link between CANopen® network and PLC	Section 5.3
Command Interface	Module Interface to the Object Dictionary	Section 5.4 and Chapter 10
SDO	Service Data Object	Subsection 5.6.4
RPDO / TPDO	Receive/Transmit Process Data Object	Subsection 5.6.5
MPDO	Multiplexed Process Data Object	Subsection 5.6.6
SYNC	Synchronization object	Subsection 5.6.7
Node guarding	Node guarding service	Subsection 5.6.8
Heartbeat	Heartbeat Service	Subsection 5.6.9
TIME	Time stamp object	Subsection 5.6.10
EMCY	Emergency object	Subsection 5.6.13
General NMT	General Network management services	Section 5.8
NMT Master	Network Management Master Services	Section 5.8
Boot-Up	Device Boot-Up Message Service	Subsection 5.8.2
Flying Master	Flexible Network Management	Subsection 5.8.11
LSS	Layer Setting Service for Devices	Subsection 5.8.12
Configuration manager	Mechanism for configuration of the Object Dictionary of other CANopen® Devices	Subsection 5.8.13
Profile CiA® 405 V2.0	Device Profile for IEC 61131-3 Programmable Devices	Section 5.9 and Chapter 7
Profile CiA® 417 V2.1	Application Profile for lift control systems	Section 5.10 and Chapter 8
Layer 2 Message mode	Layer 2 Message transmission and receive Mode	Chapter 9
PLC RUN / STOP	Module behaviour in case of PLC RUN/STOP	Chapter 11

5.2 Function Modes

The FX3U-CAN has four different function modes. The function mode is set up by BFM #21.
For further information on how to set the function mode, refer to the following section.

→ **Refer to Section 6.5**

Function Mode	Description
11 bit CAN-ID Layer 2 mode	This mode supports full access to Layer 2 of the CAN communication protocol. Customized 11-bit Identifier Layer 2 messages can be sent and raw 11-bit Identifier Layer 2 messages can be received.
29 bit CAN-ID Layer 2 mode	This mode supports full access to Layer 2 of the CAN communication protocol. Customized 29-bit Identifier Layer 2 messages can be sent and raw 29-bit Identifier Layer 2 messages can be received.
CANopen® 405 mode	This mode supports the CANopen® CiA® 405 IEC 61131-3 Programmable Device Profile.
CANopen® 417 mode	This mode supports the CANopen® CiA® 417 Lift Application Profile.

5.3 Object Dictionary

The Object Dictionary is a structure for data organization within the CANopen® network. The data within the Object Dictionary is used to set CAN bus parameters, initialize special functions, control data flow, store data in many formats and send emergency messages.
The Object Dictionary is structured in Indexes and Sub-Indexes. Each Index addresses a single parameter, a set of parameters, network input/output data or other data. A Sub-Index addresses a subset of the parameter or data of the Index.

General layout of CANopen® standard object dictionary

The general layout of the CANopen® standard object dictionary is shown below.

Index (hex)	Object
0000	Not used
0001 to 009F	Data type definitions → **Refer to Section 5.5**
00A0 to 0FFF	Reserved
1000 to 1FFF	Communication profile area (CiA® 301/CiA® 302) → **Refer to Section 5.6 and Section 5.8**
2000 to 5FFF	Manufacturer-specific profile area
6000 to 9FFF	Standardized Profile area (CiA® 417) → **Refer to Section 5.10**
A000 to AFFF	Standardized Profile area (CiA® 405) → **Refer to Section 5.9**
B000 to FFFF	Reserved

5.4 Command Interface

The Command Interface (CIF) provides access to the Object Dictionary of the FX3U-CAN and the Object Dictionary of other CANopen® nodes in the network. Using the BFM area #1000 to #1066, the various CIF functions can be used for SDO read/write, RPDO and TPDO configuration/mapping, configuration of Node Guarding, Heartbeat, Emergency Messages and others.

→ **For Command Interface, refer to Chapter 10**

Command Interface	Function Mode Selection				Reference
	Mode 405	Mode 417	Mode 11	Mode 29	
SDO Request	✓	✓	-	-	Section 10.2
Set Heartbeat	✓	✓	-	-	Section 10.3
Set Node Guarding / NMT slave assignment	✓	✓	-	-	Section 10.4
Send an Emergency Message	✓	✓	-	-	Section 10.5
Store Object Dictionary settings	✓	✓	-	-	Section 10.6
Restore Object Dictionary default settings	✓	✓	-	-	Section 10.7
Communication Mapping Modes	✓	-	-	-	Section 7.2
Display current Parameter	✓	✓	✓	✓	Section 10.8
Sending Layer 2 Message	-	-	✓	✓	Section 9.7

5.5 Data Type Definition Area

Static data types are placed in the object dictionary for definition purposes only. Indexes H0002 to H0008 may be mapped in order to define the appropriate space in the RPDO as not being used by the device. An SDO access results in an error.

→ **For RPDO, refer to Subsection 5.6.5**

Index (hex)	Sub-index (hex)	Object	Description	Data Type
0001	00	Data type definition	Reserved	-
0002	00		Signed 8bit	I8
0003	00		Signed 16bit	I16
0004	00		Signed 32bit	I32
0005	00		Unsigned 8bit	U8
0006	00		Unsigned 16bit	U16
0007	00		Unsigned 32bit	U32
0008	00		Float 32 bit	Real32
0009 to 009F	00		Reserved	-

5.6 Communication Profile Area

The table below provides a brief description and reference information for the FX3U-CAN CANopen® Object Dictionary.

Note: Stored to Flash ROM

Data will be saved in the Flash ROM by using the Store Parameter command in Index H1010. Be careful with write handling. The maximum number of writes to the built-in flash ROM is 10,000 times.

Note

Here, the RPDO and TPDO settings for CANopen® 405 mode are described.

→ **For the settings in CANopen® 417 mode, refer to the EDS file**

How to obtain EDS files

For EDS files (FX3U-CAN-405.eds, FX3U-CAN-417.eds) of FX3U-CAN, consult with your local Mitsubishi Electric representative.

Index (hex)	Sub-index (hex)	Object	Description / Set Range	Data Type	Initial Value	Read/ Write	Stored to Flash ROM

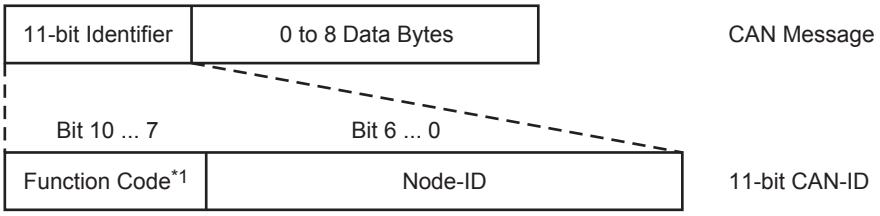
5.6.1 CAN-ID / COB-ID

Each message type on each device has a unique 11-bit identifier for bus arbitration and identification on the CAN bus. The lowest CAN-ID wins the bus arbitration. CAN-IDs with lower priority (higher CAN-ID) will wait until the bus is free.

For easier configuration, one CAN-ID scheme exists for all CANopen® devices. By default four TPDO and four RPDO are reserved for every Node-ID. To use more PDO for one node, it is necessary to use CAN-IDs of other nodes.



*1. Function code is shown below.

1. Broadcast objects (Node-ID = 0)

COB	Function Code (Binary)	Resulting CAN-ID
NMT	0000b	H0
SYNC	0001b	H80
TIME	0010b	H100

2. Peer-to-peer objects (Node-ID = 1 to 127)

COB	Function Code (Binary)	Resulting CAN-ID
EMCY	0001b	H81 to HFF
TPDO1	0011b	H181 to H1FF
RPDO1	0100b	H201 to H27F
TPDO2	0101b	H281 to H2FF
RPDO2	0110b	H301 to H37F
TPDO3	0111b	H381 to H3FF
RPDO3	1000b	H401 to H47F
TPDO4	1001b	H481 to H4FF
RPDO4	1010b	H501 to H57F
TSDO	1011b	H581 to H5FF
RSDO	1100b	H601 to H67F
NMT error control	1110b	H701 to H77F

3. Restricted CAN-IDs

In a self defined CAN-ID scheme, use of the following CAN-IDs are restricted and shall not be used as a CAN-ID by any configurable communication object.

CAN-ID (hex)	Used by COB
0	NMT
1 to 7F	Reserved
101 to 180	Reserved
581 to 5FF	Default TSDO
601 to 67F	Default RSDO
6E0 to 6FF	Reserved
701 to 77F	NMT Error Control
780 to 7FF	Reserved

5.6.2 Error Register

The object H1001 provides error information. The CANopen® device maps internal errors into this object. It is a part of the emergency object.

7	6	5	4	3	2	1	0
Manufacturer specific*1	H0	Device profile specific	Communication error (overrun, error state)*1	Temperature	Voltage	Current	Generic error*1

*1. Used by the FX3U-CAN Firmware.

The Generic error bit will always be set as long as the EMCY error code is bigger than H00FF.
The Error Register can be cleared by clearing the Pre-defined error field in object H1003.
All of these bits can be set by the Emergency message transmission command in the Command Interface.

→ **For EMCY, refer to Subsection 5.6.13**
→ **For pre-defined error field, refer to Subsection 5.6.3**
→ **For emergency message transmission command, refer to Section 10.5**

5.6.3 Pre-defined error field

This object H1003 provides the errors that occurred on the module and were signalled via the emergency object.

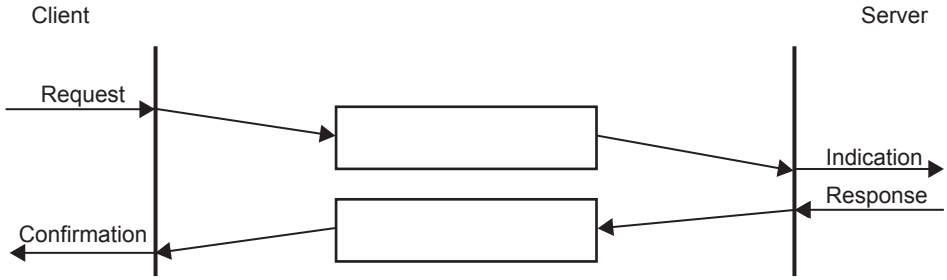
1) Sub-index H00: Number of errors
   The Sub-index H00 displays the number of errors that are recorded. Writing H0 to this Sub-index deletes the entire history. Write values other than H0 are not allowed.
2) Sub-index H01 to H0F: Standard error fields
   List of the last 15 EMCY Errors sent by FX3U-CAN. Sub-index H01 contains the newest Message and Sub-index H0F contains the oldest Message.

→ **For Emergency error codes, refers to Section 6.23**

5.6.4 SDO

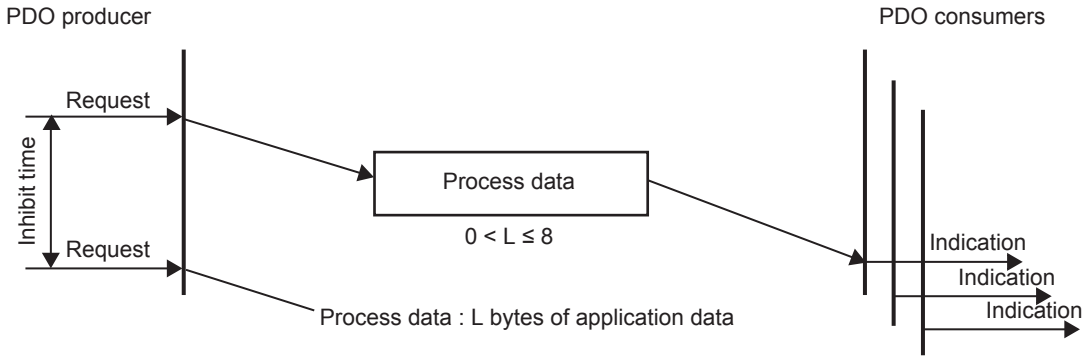
An SDO provides direct access to object entries of a CANopen® device's object dictionary. These object entries may contain data of arbitrary size and data type. SDO is used to transfer multiple data sets from a client to a server and vice versa. The client controls which data set to transfer via a multiplexer (index and sub-index of the object dictionary). By using the CIF, it is possible to make an SDO access to other CANopen® devices or to the FX3U-CAN itself. In the Object Dictionary, no configuration needed.

→ **For CIF, refer to Chapter 10**



5.6.5 RPDO / TPDO

Real-time data transfer is performed by means of Process Data Objects (PDO). PDO transfer is performed with no protocol overhead.
PDOs correspond to objects in the object dictionary and provide the interface to the application objects. Data type and mapping of application objects into a PDO is determined by a corresponding default PDO mapping structure within the object dictionary. The variable mapping of PDO and the mapping of application objects into a PDO may be transmitted to a CANopen® device during the configuration process by applying the SDO services to the corresponding objects of the object dictionary.
The PDO communication parameter describes the communication capabilities of the PDO. The PDO mapping parameter contains information about the contents of the PDO.



With the transmission type Parameter, two transmission modes are configurable:

- Synchronous transmission
- Event-driven transmission

Use the following procedure to change the PDO communication or mapping parameter:

1) The PDO must be set to invalid (Communication Parameter Sub-index H01 bit 31).
2) Set the communication Parameters
3) Set the mapping Parameters
   - Set Sub-Index H00 to the value H00.
   - Modify the mapping at Sub-Indexes H01 to H08.
   - Enable the mapping by setting the Sub-index H00 to the number of mapped objects.
4) Set the PDO to valid (Communication Parameter Sub-index H01 bit 31).

For unneeded data in an RPDO, a dummy mapping entry can be made to the data type definition Indexes to make the RPDO length fit the length of the TPDO accordingly.

→ **For data type definitions indexes, refer to Section 5.5**

1. Object H1400 to H144F

1) Sub-index H01: RPDO COB-ID

31	30	29	28 ... 11	10 ... 0
Valid	Reserved	H0	H0000	11-bit CAN-ID

Bit No.	Item	Description
Bit 0 to 10	11-bit CAN-ID	11-bit CAN-ID of the CAN base frame → **For COB-ID, refer to Subsection 5.6.1**
Bit 11 to 28	-	Bit 11 to 28 fixed to OFF (0).
Bit 29	-	Bit 29 fixed to OFF (0).
Bit 30	Reserved This bit fixed to OFF (0).	
Bit 31	Valid	OFF (0): Valid ON (1): Invalid

2) Sub-index H02: RPDO transmission type

Value (hex)	Description
00 to F0	Synchronous Received PDO data will be processed after the next SYNC message, independent of the transmission rate specified by the transmission type.
F1 to FD	Reserved
FE	Event-driven (Function Mode 405)
FF	Event-driven (Function Mode 417)

3) Sub-index H03: RPDO inhibit time
For RPDOs, the inhibit time has no function.

4) Sub-index H05: RPDO event-timer
The RPDO event timer is used for deadline monitoring.
When the time elapsed without receiving an event driven object (transmission type is set to HFE or HFF) an EMCY with the error code H8250 will be sent.
The value is a multiple of 1ms. The value 0 disables the event-timer.
→ **For emergency error code, refer to Section 6.23**

2. Object H1600 to H164F Sub-index H01 to H08: RPDO mapping parameter

The default mapping is to unsigned 16 bit objects.
→ **Refer to Subsection 7.1.2**

31 ... 16	15 ... 8	7 ... 0
Index	Sub-index	Length

Example:
To map the first unsigned 16bit data of RPDO1 to BFM0, set Index H1600 Sub-index H01 to HA5800110.
This stands for Object Dictionary Index HA580, Sub-index H01 and a data size of 16bit.

Item	Description
Index	Index of the mapped Object
Sub-index	Sub-index of the mapped Object
Length	Bit length of the mapped Object

3. Object H1800 to H184F

1) Sub-index H01: TPDO COB-ID

31	30	29	28 ... 11	10 ... 0
Valid	RTR	H0	H00000	11-bit CAN-ID

Bit No.	Item	Description
Bit 0 to 10	11-bit CAN-ID	11-bit CAN-ID of the CAN base frame → **For COB-ID, refer to Subsection 5.6.1**
Bit 11 to 28	-	Bit 11 to 28 fixed to OFF (0).
Bit 29	-	Bit 29 fixed to OFF (0).
Bit 30	RTR	OFF (0): Remote transmission request (RTR) allowed ON (1): Remote transmission request (RTR) not allowed This bit is constantly set to ON in the FX3U-CAN.
Bit 31	valid	OFF (0): Valid ON (1): Invalid

2) Sub-index H02: TPDO transmission type

Value (hex)	Description
00	Synchronous (acyclic) The PDO will be transmitted once (acyclic) after occurrence of the SYNC if an event occurred before the SYNC.
01	Synchronous (cyclic every SYNC)
02	Synchronous (cyclic every 2nd SYNC)
03	Synchronous (cyclic every 3rd SYNC)
⋮	⋮
F0	Synchronous (cyclic every 240th SYNC)
F1 to FD	Reserved
FE	Event-driven (Function Mode 405)
FF	Event-driven (Function Mode 417)

3) Sub-index H03: TPDO inhibit time
This object configures the minimum time between two PDO transmissions if the transmission type is set to HFE or HFF. PDO transmission request over BFM #20 will be dismissed during this time. Unit of this value is 100 µs (FX3U-CAN counting resolution: 1 ms). The value 0 disables the inhibit time.
→ **For BFM #20, refer to Section 6.4**

4) Object H1800 to H184F Sub-index H05: TPDO event-timer
If the event timer elapses and an event driven transmission is not sent in that time (transmission type is set to HFE or HFF), a message will be sent with the current value of the Object dictionary. Unit of this value is ms. The value 0 disables the event-timer.

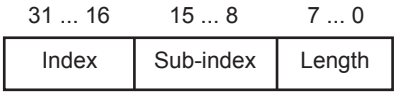
Note

If the inhibit time is active, no PDO will be transmitted.

4. Object H1A00 to H1A4F Sub-index H01 to H08: TPDO mapping parameter

The default mapping is to unsigned 16 bit objects.

→ **Refer to Subsection 7.1.1**



Example:

To map unsigned 16bit data of BFM0 to the first 16 bits of TPDO 1, set Index H1A00 Sub-index H01 to HA1000110.

This stands for Object Dictionary Index HA100, Sub-index H01 and a data size of 16bit.

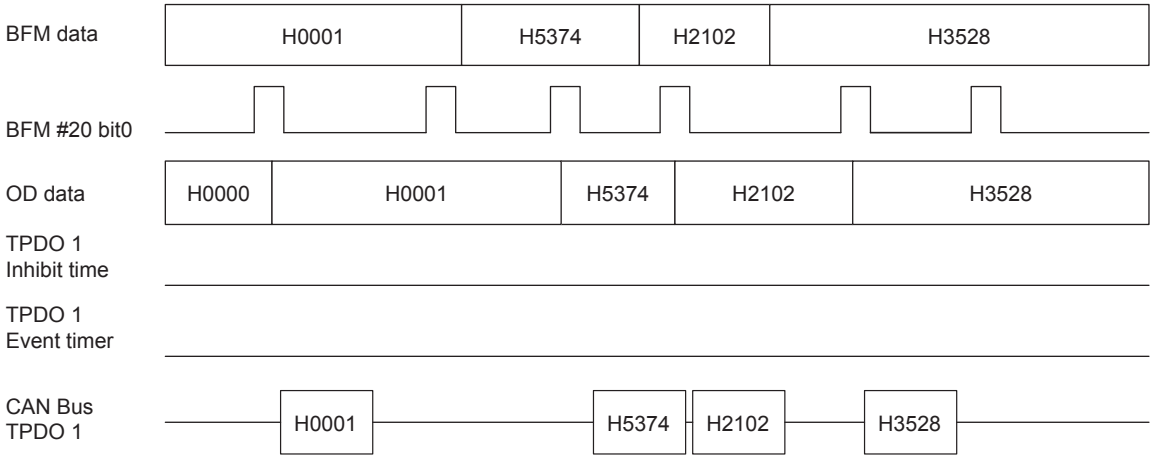
Item	Description / set range
Index	Index of the mapped Object
Sub-index	Sub-index of the mapped Object
Length	Bit length of the mapped Object

Timing chart

The following figures show the relation between Transmit Process Data BFM's (BFM data), BFM #20 bit 0, PDO Inhibit time, PDO Event timer and CAN bus data in NMT state Operational for event driven PDO's.
Note that the event and inhibit timer are started every time when PDO transmission is started.

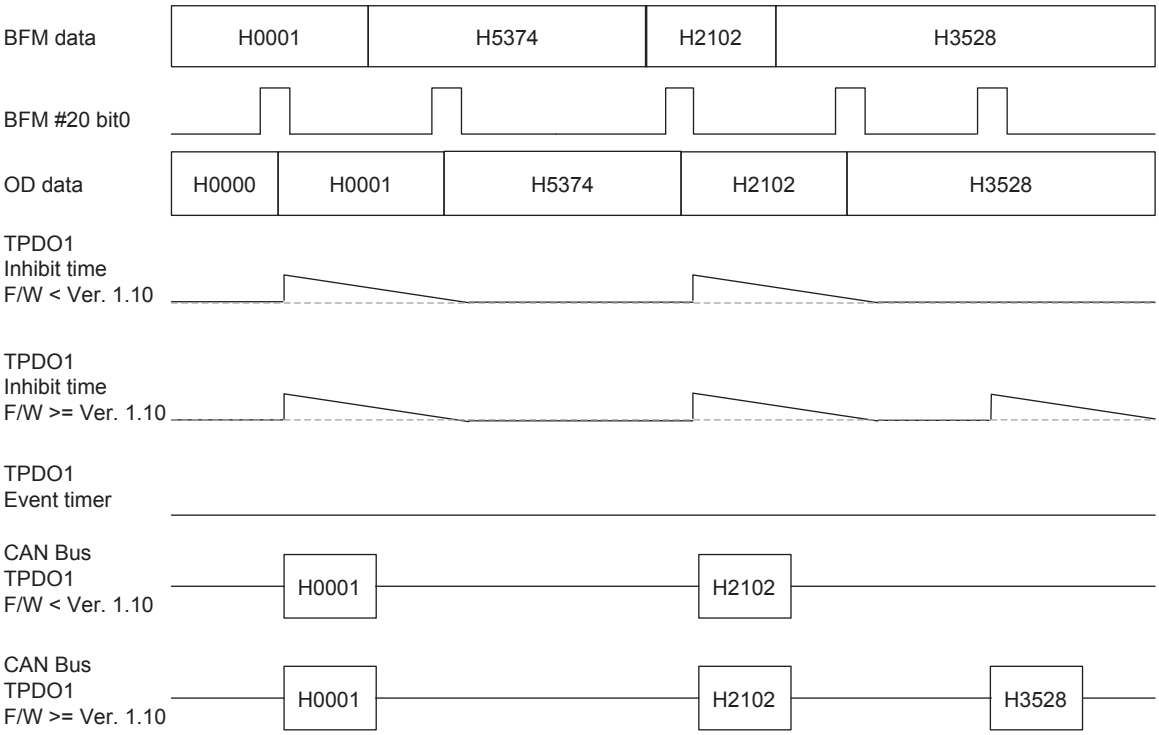
Example 1: Inhibit time = 0, Event time = 0

The BFM data will be copied into the Object dictionary and a PDO will be sent every time when the data are changed and a data exchange is triggered. If the data are not changed, no PDO will be sent if a data exchange is triggered by BFM #20.

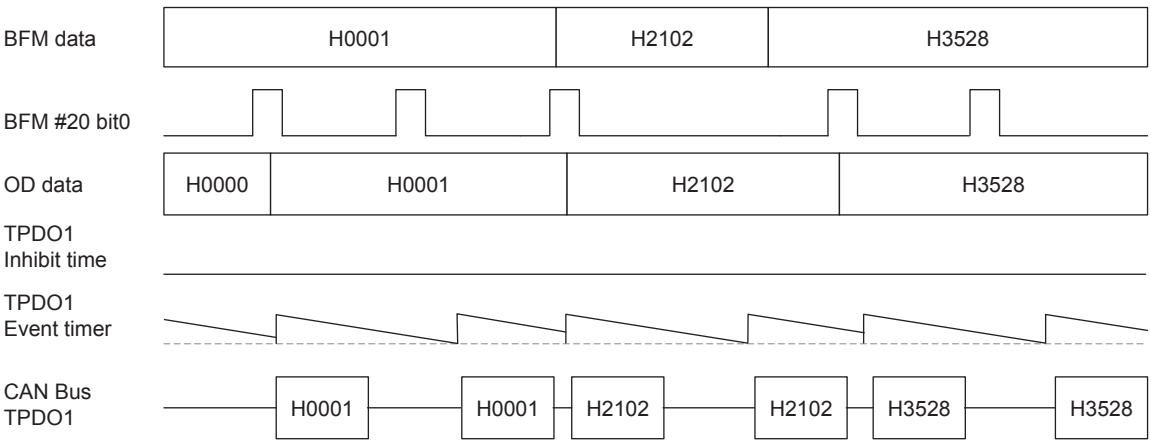


Example 2: Inhibit time > 0, Event time = 0
The BFM data will be copied into the Object dictionary and a PDO will be sent every time when the data are changed and the inhibit time is not running. If the inhibit time is active and the data are changed before the inhibit time elapsed, the former data will not be sent as PDO.

- Before FX3U-CAN firmware version 1.10
  If the data are not changed, no PDO will be sent if a data exchange is triggered by BFM #20.
- FX3U-CAN firmware version 1.10 or later
  If a data exchange is triggered by BFM #20 and at the last data exchange the inhibit time was active, a PDO will be sent, otherwise no PDO will be sent as long as the data did not change.



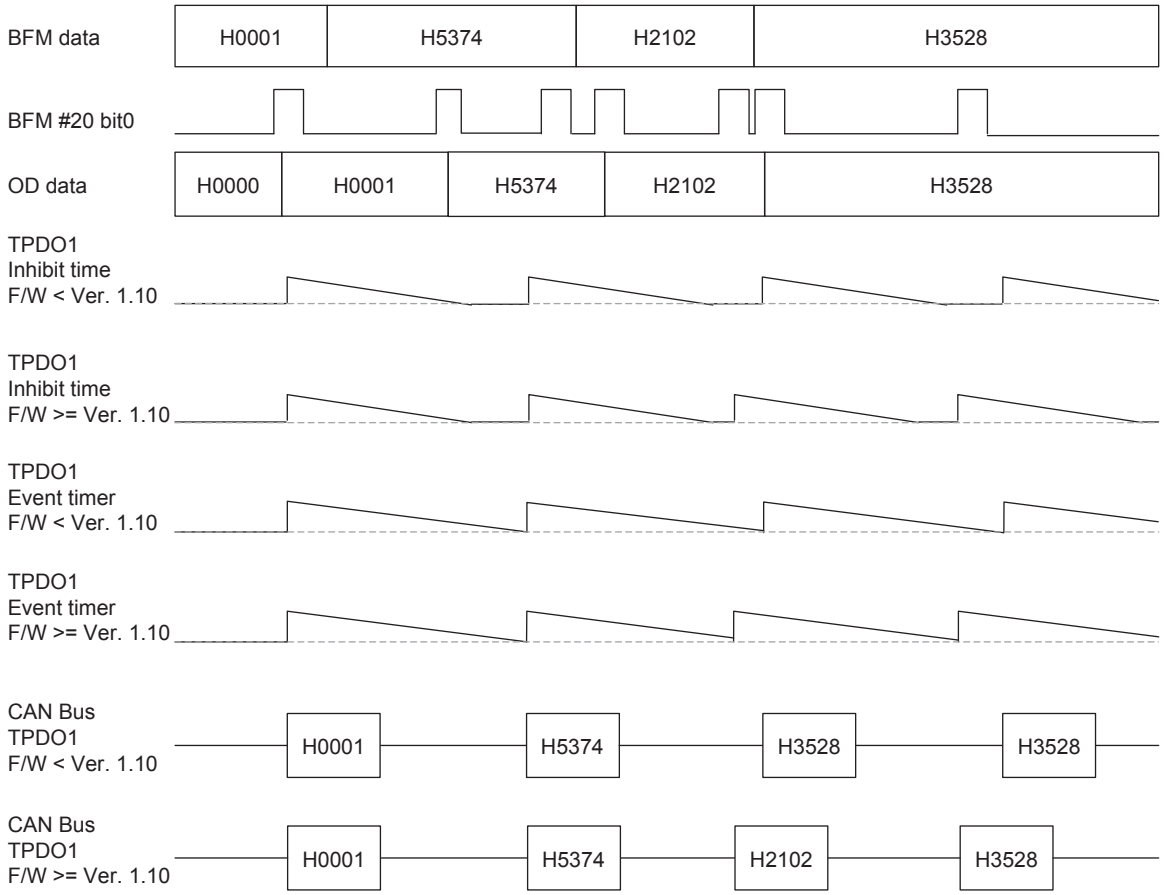
Example 3: Inhibit time = 0, Event time > 0
The BFM data will be copied into the Object dictionary and a PDO will be sent every time when the data are changed. Even if no data exchange with new data is triggered by BFM #20, a PDO with the actual object dictionary data will be sent when the event timer elapsed.



Example 4: Inhibit time > 0, Event time > 0, Inhibit time < Event time
The BFM data will be copied into the Object dictionary. A PDO will be sent every time when the data are changed and the inhibit time is not running. If the inhibit time is active and the data are changed before the inhibit time elapsed, the former data will not be sent as PDO.

- Before FX3U-CAN firmware version 1.10
  If the data are not changed, no PDO will be sent if a data exchange is triggered by BFM #20.
- FX3U-CAN firmware version 1.10 or later
  If a data exchange is triggered by BFM #20 and at the last data exchange the inhibit time was active, a PDO will be sent, otherwise no PDO will be sent as long as the data did not change.

If no data exchange with new data is triggered by BFM #20, a PDO with the actual object dictionary data will be sent when the event timer elapsed and the inhibit time is not active.
The inhibit time in combination with the event timer allows new PDO data to be sent without the need to retrigger the data exchange by BFM #20 for the case that during the first data exchange of new data the inhibit time was active.



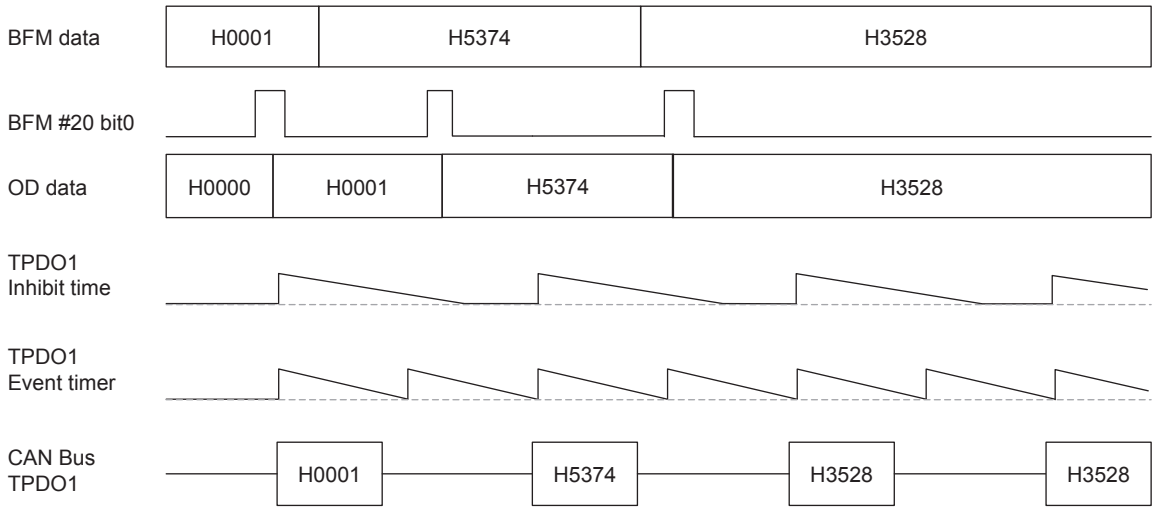
Example 5: Inhibit time > 0, Event time > 0, Inhibit time > Event time

The BFM data will be copied into the Object dictionary and a PDO will be sent every time when the data are changed and the inhibit time is not running. If the inhibit time is active and the data are changed before the inhibit time elapsed, the former data will not be sent as PDO.

If the data are not changed, no PDO will be sent if a data exchanged is triggered by BFM #20.

If no data exchange with new data is triggered by BFM #20, a PDO with the actual object dictionary data will be sent when the event timer elapsed and the inhibit time is not active. If the inhibit time is active the event timer starts running again without a PDO being sent.

The inhibit time in combination with the event timer allows new PDO data to be sent without the need to retrigger the data exchange by BFM #20 for the case that during the first data exchange of new data the inhibit time was active.



5.6.6 MPDO

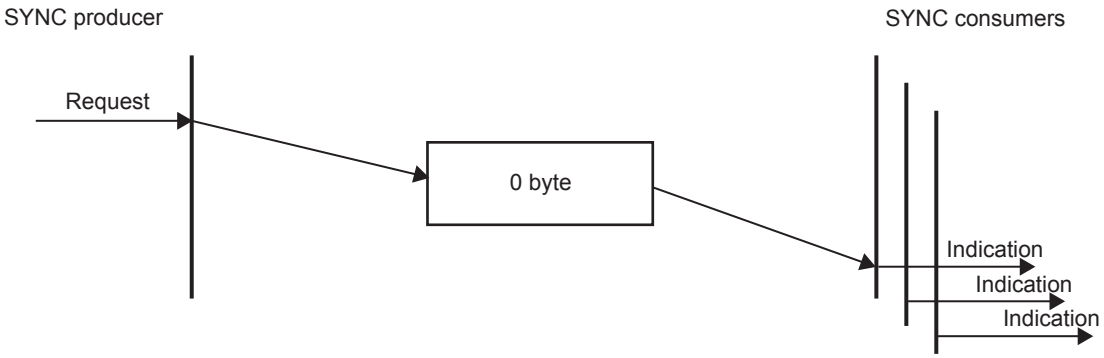
A Multiplexed PDO, like an SDO, provides direct write access to objects of a CANopen® device's object dictionary. The size of the data of these objects is limited to a maximum of 4 bytes.

The MPDO service can only be used in the CiA® 417 Lift Application Mode and does not have to be configured.

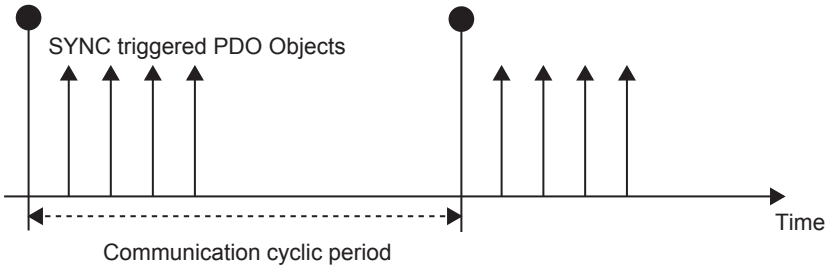
Process data:
Data less than 4 bytes is filled with H0 to make it 32 bits.

5.6.7 SYNC

The SYNC producer broadcasts the synchronization object periodically. The SYNC message provides the basic network synchronization mechanism. The time period between SYNC messages is specified by the standard parameter communication cycle period. There may be a time jitter in transmission by the SYNC producer corresponding approximately to the latency from some other message being transmitted just before the SYNC.



SYNC Object



1. Object H1005: COB-ID SYNC message

In order to guarantee timely access to the network, the SYNC is given a very high priority CAN-ID.

→ **For the COB-ID, refer to Subsection 5.6.1**

31	30	29	26 ... 11	10 ... 0
X	gen.	H0	H00000	11-bit CAN-ID

Bit No.	Item	Description / set range
Bit 0 to 10	11-bit CAN-ID	11-bit CAN-ID of the CAN base frame
Bit 11 to 28	-	Bit 11 to 28 fixed to OFF (0).
Bit 29	-	Bit 29 fixed to OFF (0).
Bit 30	gen.	OFF (0): Don't generate SYNC message ON (1): Generate SYNC message **Note:** • The device needs to be active NMT Master to produce SYNC messages. • The Index H1006 needs to be set to enable SYNC producing.
Bit 31	X	Do not care

2. Object H1006: Communication cycle period

This object provides the communication cycle period. This period defines the SYNC interval. The 32 bit value is in units of µs (FX3U-CAN counting resolution: 1 ms).
The FX3U-CAN counting resolution is 1ms, values smaller than 1ms will be set internally to 1ms, values starting from 1ms will be divided by 1000.
The value 0 disables SYNC producing. The module needs to be active NMT Master to produce SYNC messages.
Setting range: K0 to K4,294,967,295

→ **For NMT Master, refer to Subsection 5.8.5**

5.6.8 Node guarding

This protocol is used to detect remote errors in the network. Each NMT slave serves one requests message for the node guarding protocol.
The NMT master polls each NMT guarding slave at regular time intervals. This time-interval is called the guard time and may be different for each NMT slave. The response of the NMT slave contains the NMT state of that NMT slave. The node lifetime is given by guard time multiplied by lifetime factor. The node lifetime may be different for each NMT slave. If the NMT slave has not been polled during its lifetime, a remote node error is indicated through the NMT service life guarding event. A remote node error is indicated through the NMT service node guarding event if:

NMT master:

- The NMT master does not receive confirmation after the Guarding request within the node life time.
- The response of the NMT guarding slave state does not match the expected state.

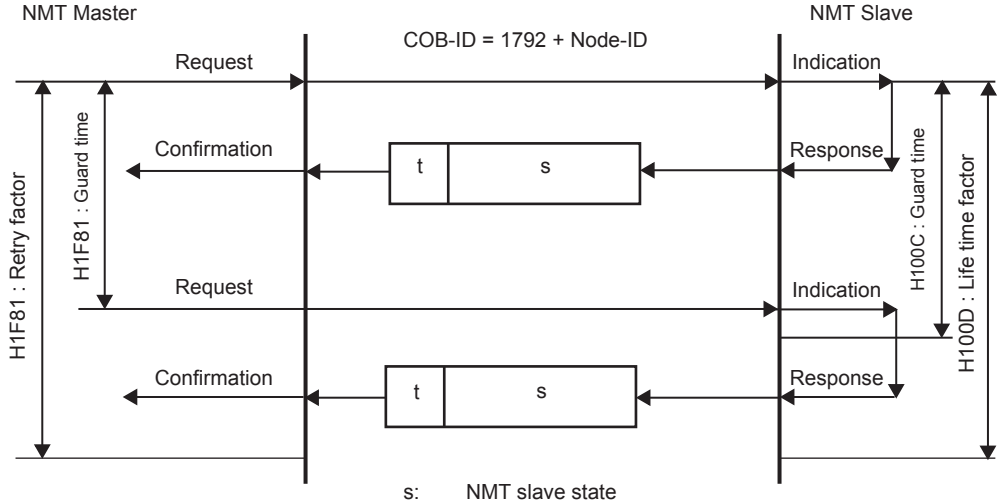
NMT slave:

- The NMT guarding slave did not receive the NMT master Guarding request polling for time set in H100C and H100D.

If a remote error occurred previously but the errors in the guarding protocol have disappeared, it will be indicated that the remote error has been resolved through the NMT service node guarding event and the NMT service life guarding event.
If Heartbeat is activated, the Node guarding settings will be ignored.

Note

- As Slave, the FX3U-CAN (firmware Ver. 1.10 or later) supports Node Guarding.
  Use the heartbeat service for FX3U-CAN not supporting Node Guarding.
- Node guarding produces a high bus load. It is recommended to use heartbeat instead.



s: NMT slave state
4 Stopped
5 Operational
127 Pre-Operational
t: Toggle Bit

1. Slave Setting

1) Object H100C: Guard time
   The 16bit guard time in units of ms is the time limit for which the response must be sent. The value 0 disables life guarding.
   Applicable for FX3U-CAN firmware Ver. 1.10 or later.
2) Object H100D: Life time factor
   The 8bit life time factor value multiplied by the guard time gives the life time for which the NMT Master has to send the guarding request. The value 0 disables life guarding.
   Both Objects have to be set to activate Node guarding. The order in which Guard time and Life time factor are set does not matter.
   Applicable for FX3U-CAN firmware Ver. 1.10 or later.

2. Master Setting

1) Object H1F81: NMT slave assignment

→ **Refer to Subsection 5.8.7**

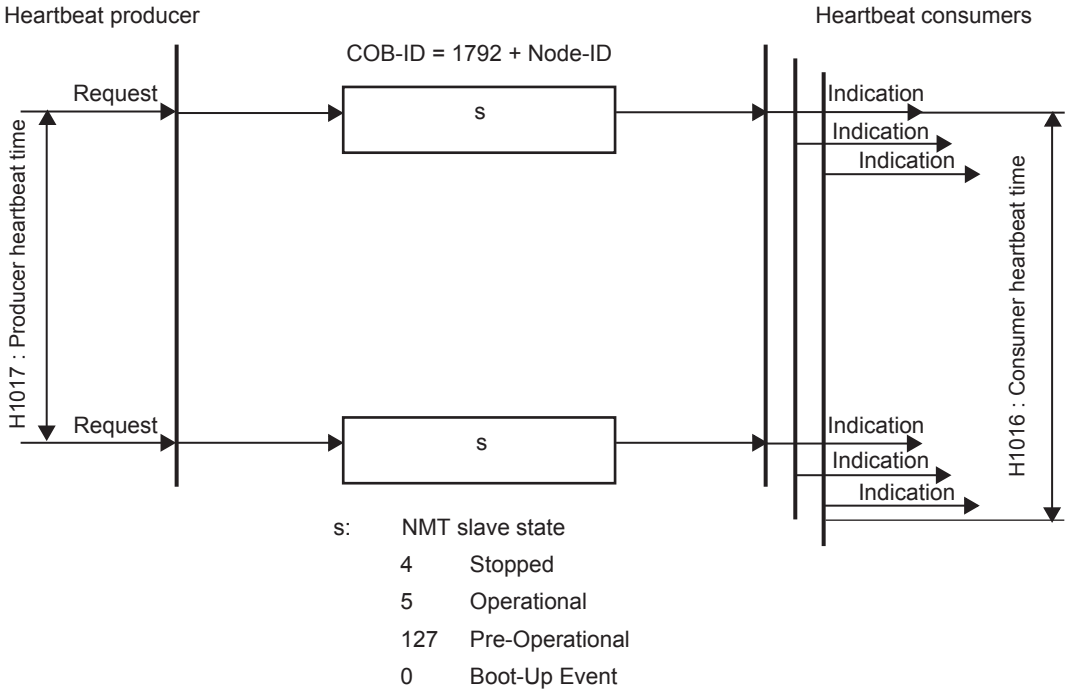
5.6.9 Heartbeat

The heartbeat protocol defines an error control service that does not use requests. A heartbeat producer transmits a heartbeat message cyclically. One or more heartbeat consumers receive the indication. The relationship between producer and consumer is configurable via the object dictionary. The heartbeat consumer guards the reception of the heartbeat within the heartbeat consumer time. If the heartbeat is not received within the heartbeat consumer time, a heartbeat event will be generated.
If the FX3U-CAN module is configured as Flying Master, Heartbeat producing and consuming is automatically activated between it and other FX3U-CAN modules also set up as Flying Masters.

→ **For Flying Master, refer to Subsection 5.8.11**

Note

Heartbeat produces a high bus load, but only half that of node guarding.



1. Object H1016 sub-index H01 to H7F: Consumer heartbeat time

The consumer heartbeat time object indicates the expected heartbeat cycle times. Monitoring of the heartbeat producer starts after reception of the first heartbeat. The consumer heartbeat time should be higher than the corresponding producer heartbeat time. Before reception of the first heartbeat, the status of the heartbeat producer is unknown.

31 ... 24	23 ... 16	15 ... 0
H00	Node-ID	Heartbeat time

If the heartbeat time is 0 or the node-ID is 0 or greater than 127, the corresponding object entry is not used.
The unit of heartbeat time is ms.

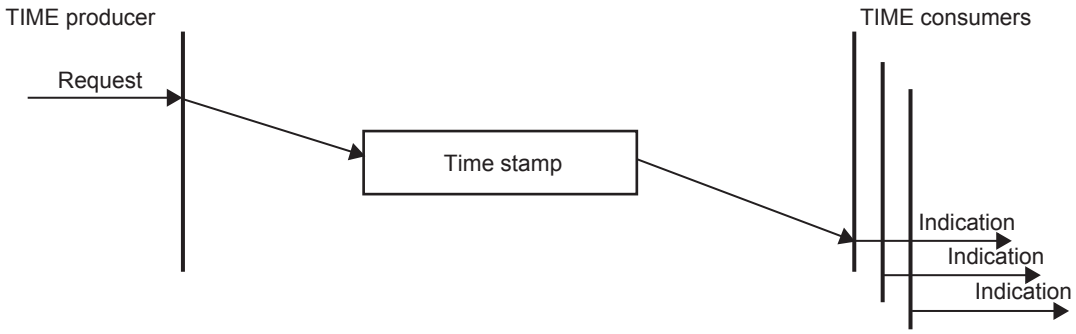
2. Object H1017: Producer heartbeat time

The unit of 16bit producer heartbeat time is ms. The value 0 disables the producer heartbeat.

5.6.10 TIME

The TIME producer broadcasts the time stamp object. This TIME provides the simple network clock. The time stamp contains the Time of day, which is represented by a 48 bit sequence. These sequences represent the time in milliseconds after midnight (28 bits) and the number of days since 1984-01-01 (16 bits). Only one Timestamp producer is allowed in the Network.
The time and the date have to be configured by setting BFM #51 to #57 (clock data).
In order to guarantee timely access to the network, the TIME is given a very high priority CAN-ID. CANopen® devices that operate a local clock may use the TIME object to adjust their own time base to that of the time stamp object producer.
The consuming and producing setting can be directly changed by BFM #50.
In case of time overflow (time later than 31st December 2099 23:59.59), the time returns to 1st January 2000 00:00:00. Buffer memory display for year will be 00 to 99 in all cases.
Note for TIME consuming: A received Time stamp before 1st January 2000 00:00.00 is set to 1st January 2000 00:00:00.

→ **For time stamp BFM #50 to #59, refer to Section 6.19**



Object H1012: COB-ID time stamp object

→ **For the resulting COB-ID, refer to Subsection 5.6.1**

31	30	29	26 ... 11	10 ... 0
consume	produce	H0	H00000	11-bit CAN-ID

Bit No.	Item	Description
Bit 0 to 10	11-bit CAN-ID	11-bit CAN-ID of the CAN base frame
Bit 11 to 28	-	Bit 11 to 28 fixed to OFF (0).
Bit 29	-	Bit 29 fixed to OFF (0).
Bit 30	produce	OFF (0): Do not produce TIME Messages ON (1): Produce TIME Messages Note: The FX3U-CAN needs to be active NMT Master to produce TIME messages.
Bit 31	consume	OFF (0): Do not consume TIME Messages ON (1): Consume TIME Messages

5.6.11 Store parameters

To store all parameters to non-volatile memory, write SDO H65766173 (ISO8859 String code: "save") to Object Index H1010, Sub-Index H01 or use the store command in the CIF. After each power-up or reset, the saved parameters will be valid.

→ **For the store command in the CIF, refer to Section 10.6**

Note

For CDCF files stored on Object H1F22, the store parameter command is not necessary.
On read access, the CANopen® device gives back information about its storage functionality:

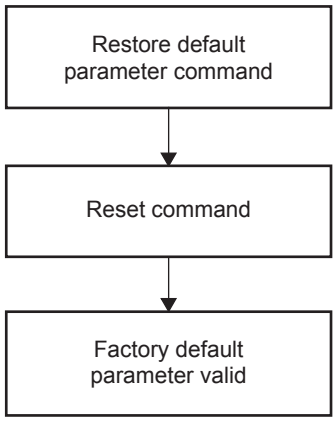
Bit No.	Description
Bit 0	OFF (0): Device does not save parameter on command. ON (1): Device saves parameter on command. (FX3U-CAN)
Bit 1	OFF (0): Device does not save parameter without user request. (FX3U-CAN) ON (1): Device saves parameter without user request.
Bit 2 to 31	Reserved

5.6.12 Restore default parameters

To restore factory default parameters, write SDO H64616F6C (ISO8859 code: daol ("load")) to Object Index H1011, Sub-Index H01 or use the restore command in the CIF. The stored parameters are then overwritten to factory default settings.

→ **For the restore command in the CIF, refer to Section 10.7**

Restore procedure:



Note

- Do not execute a store parameter command before executing the reset command. Otherwise the factory default parameters will be overwritten with the previous settings.
- CDCF files stored on Object H1F22 will be also cleared and will be cleared directly before the Reset command.

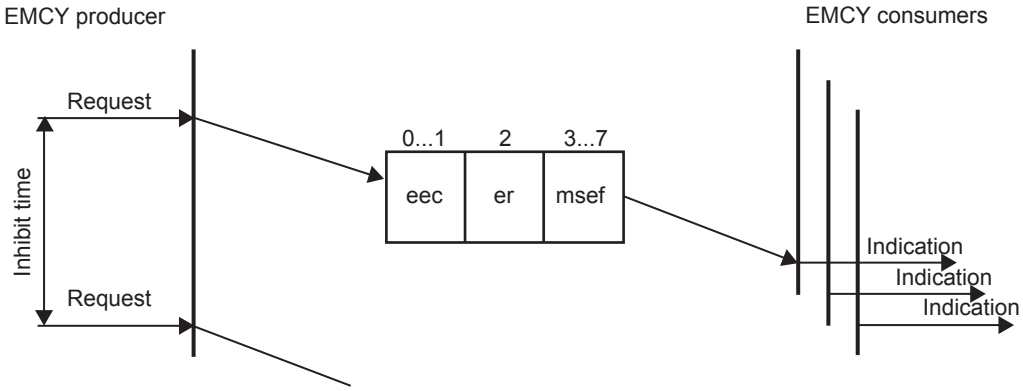
On read access, the CANopen® device gives back information about its restoring functionality:

Bit	Description / set range
Bit 0	OFF (0): Device is not able to restore factory default parameters on command. ON (1): Device is able to restore factory default parameters on command. (FX3U-CAN)
Bit 1 to 31	Reserved

5.6.13 EMCY

Emergency objects are triggered by the occurrence of a CANopen® device internal error. An emergency object is transmitted only once per "error event." No further emergency objects are transmitted as long as no new errors occur on a CANopen® device. Zero or more emergency consumers may receive the emergency object. The received EMCY Messages will be displayed in BFM #750 to #859. A transmission of EMCY Messages is possible over the CIF.

→ **For BFM #750 to #859 Emergency Message Buffer, refer to Section 6.23**
→ **For sending an CIF EMCY Message in the CIF, refer to Section 6.23**



eec: Emergency error code (2 Byte)

→ **For Emergency error code, refer to Section 6.23**

er: Error register (1 Byte)

→ **For Error register (object H1001), refer to Subsection 5.6.2**

msef: Manufacturer-specific error code (5 Byte)

1. Object H1014: COB-ID EMCY

31	30	29	28 ... 11	10 ... 0
valid	H0	H0	H00000	11-bit CAN-ID

→ **For the resulting COB-ID, refer to Subsection 5.6.1**

Bit No.	Item	Description
Bit 0 to 10	11-bit CAN-ID	11-bit CAN-ID of the CAN base frame
Bit 11 to 28	-	Bit 11 to 28 fixed to OFF (0).
Bit 29	-	Bit 29 fixed to OFF (0).
Bit 30	-	Bit 30 fixed to OFF (0).
Bit 31	valid	OFF (0): EMCY producing is valid ON (1): EMCY producing is not valid

Note

On the FX3U-CAN, the setting is fixed and can not be changed.

2. Object H1015: Inhibit time EMCY

This object configures the minimum time between two EMCY messages. The unit of the 16 bit value is 100 µs. The value 0 disables the inhibit time.
The FX3U-CAN counting resolution is 1ms, values smaller than 1ms will set internally to 1ms, values starting from 1ms will be divided by 1000.

3. Object H1028 sub-index H01 to H7F: Emergency consumer object

This Object configures the COB-IDs for the EMCY objects that the module is consuming. The Sub-index refers to the related node-ID.

31	30	29	28 ... 11	10 ... 0
valid	H0	H0	H00000	11-bit CAN-ID

→ **For the resulting COB-ID, refer to Subsection 5.6.1**

Bit No.	Item	Description
Bit 0 to 10	11-bit CAN-ID	11-bit CAN-ID of the CAN base frame
Bit 11 to 28	-	Bit 11 to 28 fixed to OFF (0).
Bit 29	-	Bit 29 fixed to OFF (0).
Bit 30	-	Bit 30 fixed to OFF (0).
Bit 31	valid	OFF (0): EMCY consuming of remote Node is valid ON (1): EMCY consuming of remote Node is not valid

5.7 Error Behaviour

If a serious CANopen® device failure is detected in NMT state Operational, the CANopen® device automatically shifts to the NMT state Pre-operational by default. Alternatively, the CANopen® device can be configured to change to NMT state Stopped or remain in the current NMT state.

CANopen® device failures include the following communication errors:

- Bus-off conditions of the CAN interface
- Only as NMT Slave: Life guarding event with the state 'occurred' and the reason 'time out'
- Only as NMT Slave: Heartbeat event with state 'occurred' and the reason 'time out'
- PLC RUN → STOP: If the setting value is H01, the FX3U-CAN will change into Pre-operational but can be set again to Operational when the PLC is in STOP.
  With the setting value H00 or H02, the FX3U-CAN can not set into Operational as long as the PLC is in STOP.
- FROM/TO Watchdog error: If the setting value is H01, the FX3U-CAN will change into Pre-operational but can be set again to Operational when the BFM #29 bit 7 is set.
  With the setting value H00 or H02, the FX3U-CAN can not set into Operational as long as the BFM #29 bit 7 is set.

→ **For FROM/TO Watchdog, refer to Section 6.9**
→ **For FROM/TO Watchdog error, refer to Section 14.2**

Severe CANopen® device errors also may be caused by CANopen® device internal failures.

Object H1029 sub-index H01: Error behaviour object

Error class values

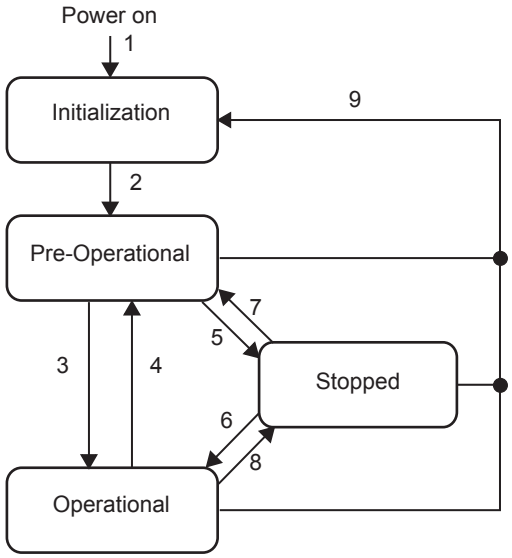
Value (hex)	Description
00	Change to NMT state Pre-operational (only if currently in NMT state Operational)
01	No change of the NMT state. Refer to different behaviour in case of PLC RUN → STOP.
02	Change to NMT state Stopped
03 to FF	Not used

5.8 Network Management

The NMT provides services for controlling the network behaviour of CANopen® devices. All CANopen® devices of a network referred to as NMT slaves are controlled by services provided by an NMT master. The NMT master is typically also the Application master at the same time, but it is not necessary.
The FX3U-CAN supports the master functions NMT startup master, Flying master, Configuration manager, SYNC producer, TIME producer and LSS master which are described in the sections before and below.

5.8.1 CANopen® Boot-Up Procedure and NMT states

CANopen® devices shift to the NMT state Pre-operational directly after finishing device initialization. In this NMT state, CANopen® device parameterization and CAN-ID-allocation via SDO (e.g. using a configuration tool) is possible. Then the CANopen® devices may be switched directly or by the NMT startup master into the NMT state Operational.



State Change	Description
1	At Power on, shifts to the NMT state initialization automatically.
2	After the NMT state initialization finishes, shifts to the "NMT state Pre-operational" automatically and sends a Boot-Up message → **Refer to Subsection 5.8.2**
3	NMT service start remote node indication
4, 7	NMT service enter pre-operational indication
5, 8	NMT service stop remote node indication
6	NMT service start remote node indication
9	NMT service reset node indication or reset communication indication

1. NMT state Pre-operational

In the NMT state Pre-operational, communication via SDO is possible. PDO communication is not allowed. Configuration of PDO, parameters and also the allocation of application objects (PDO mapping) may be performed by a configuration application. The CANopen® device may be switched into the NMT state Operational directly by sending the NMT service start remote node.

2. NMT state Operational

In the NMT state Operational, all communication objects are active.

3. NMT state Stopped

By switching a CANopen® device into the NMT state Stopped, it is forced to stop all communication. Furthermore, this NMT state may be used to achieve certain application behaviour.

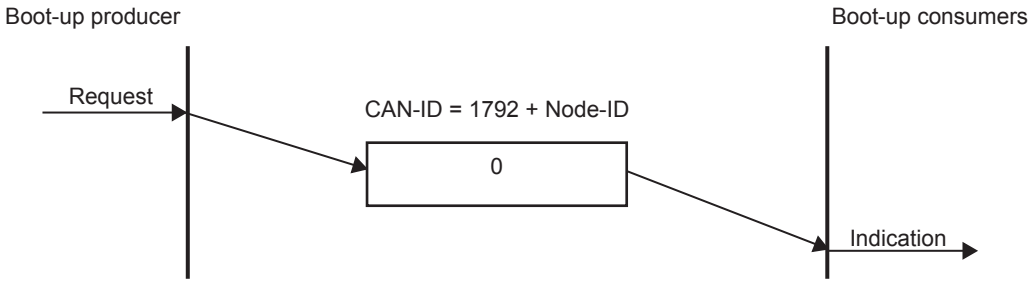
4. NMT States and communication object relation

The relation between NMT states and communication objects is shown in the following table. Services in the listed communication objects may only be executed if the CANopen® devices involved in the communication are in the appropriate NMT states.
In case of trying to send a communication object which is not allowed in the specific NMT state, no error information will be displayed.

	Pre-operational	Operational	Stopped
PDO	-	✓	-
SDO	✓	✓	-
SYNC	✓	✓	-
EMCY	✓	✓	-
TIME	✓	✓	-
Node control and error control	✓	✓	✓

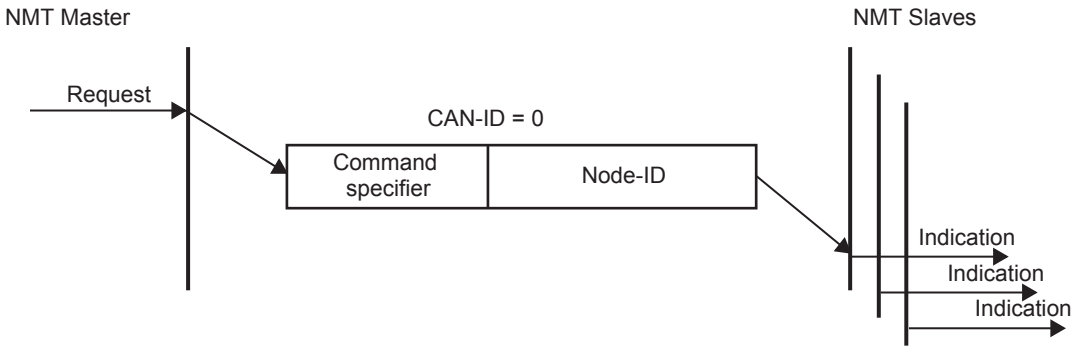
5.8.2 Protocol Boot-Up

This protocol is used to signal that a NMT slave has switched to the NMT state Pre-operational after the NMT state Initialization. The protocol uses the same CAN-ID as the error control protocols.
One data byte is transmitted with value 0.



5.8.3 Protocol NMT (Node control)

This Protocol is used by the NMT Master to control the NMT state of remote Nodes. Producing is allowed only by the NMT Master.
If the module is the active NMT master, the module is ignoring NMT messages with the Node-ID 0 (All Nodes).



Command specifier (1 byte)	
1	Start
2	Stop
128	Pre-Operational
129	Reset Application
130	Reset Communication

Node-ID (1 byte)	
0	All Nodes
1 to 127	Selected Node

5.8.4 NMT slave identification

The NMT startup master and the LSS master are using the NMT slave identification data to identify the NMT slave before configuring the NMT slave.
If the configured identification data on the NMT master are different than responded from the NMT slave, the NMT startup master service will stop the startup of this NMT slave.
The Sub-index corresponds to the NMT slave Node-ID. The default value 0 has the meaning not configured, and the NMT master will skip this entry.
For the LSS Master all NMT slave Identification data need to be configured! For the NMT Startup Master, the NMT slave identification entries are optional.

1. **Object H1F84 Sub-index H01 to H7F: Device Type**
   The sub-index corresponds to the Node-ID.
   The value refers to the object H1000 sub-index 00 of the corresponding Node-Id.
2. **Object H1F85 Sub-index H01 to H7F: Vendor identification**
   The sub-index corresponds to the Node-ID.
   The value refers to the object H1018 sub-index 01 of the corresponding Node-Id.
3. **Object H1F86 Sub-index H01 to H7F: Product code**
   The sub-index corresponds to the Node-ID.
   The value refers to the object H1018 sub-index 02 of the corresponding Node-Id.
4. **Object H1F87 Sub-index H01 to H7F: Revision number**
   The sub-index corresponds to the Node-ID.
   The value refers to the object H1018 sub-index 03 of the corresponding Node-Id.
5. **Object H1F88 Sub-index H01 to H7F: Serial number**
   The sub-index corresponds to the Node-ID.
   The value refers to the object H1018 sub-index 04 of the corresponding Node-Id.

5.8.5 NMT master startup

The NMT startup master behaves according to the NMT state machine as defined in Subsection 5.8.1. Before the NMT master transitions from NMT state Pre-operational to NMT state Operational, all assigned NMT slaves shall be booted.
The Main flow chart for the NMT master startup is shown in Figure 5.1
Figure 5.2 is a simple startup overview to show the influence of the BFM #70 setting. It is recommended not to use the simple startup because it can not be guaranteed that every NMT Slave will be set into Operational state. Setup the NMT slave startup values for every connected NMT slave on the NMT master instead.

→ **For NMT slave startup, refer to Subsection 4.7.6**

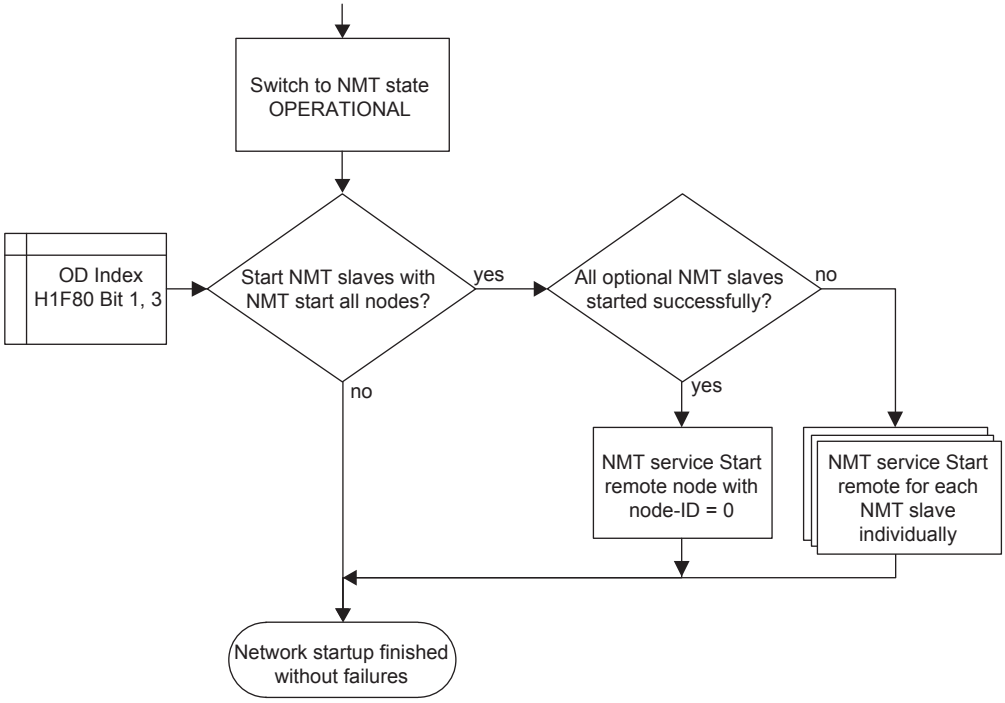

Figure 5.2: NMT Master simple startup

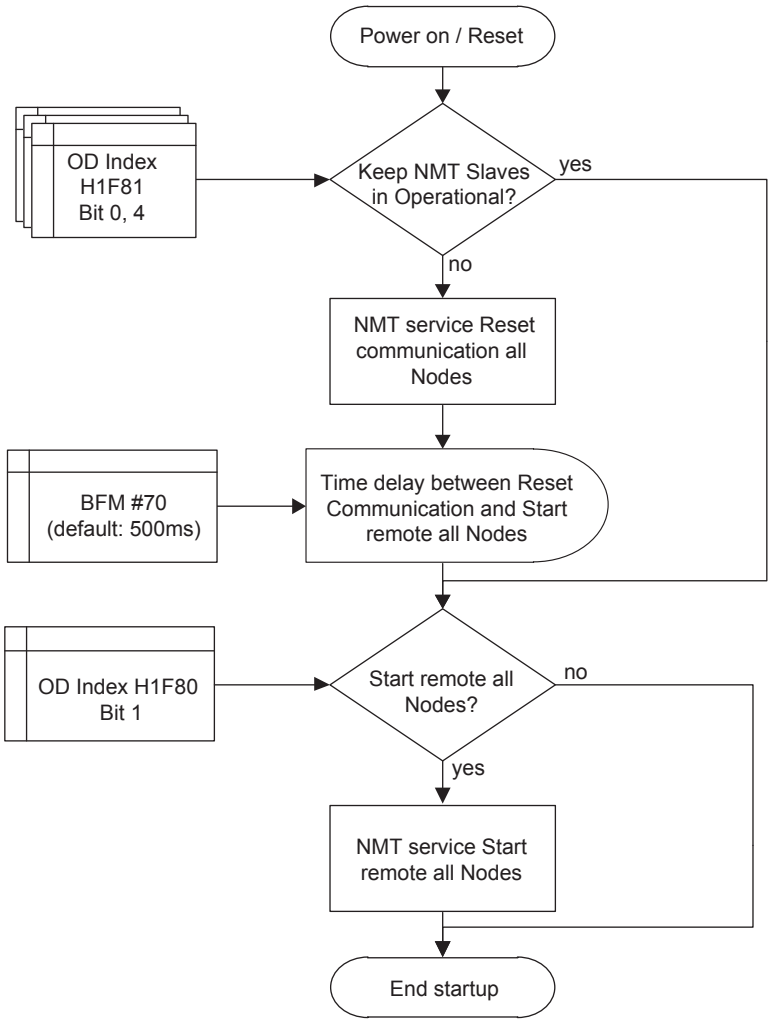
This overview is a more simple overview of the total NMT master startup without any NMT Slave setting in Object Dictionary Index H1F81. Refer to the other figure to see the whole process.



Object H1F80: NMT startup

This object configures the start up behaviour of a CANopen® device via SDO access. If the node is set as Master without the flying master capability, the node starts as NMT master and ignores "all Nodes" NMT commands from the network. After the FX3U-CAN has been configured as the NMT master, parameters have to be stored, and the FX3U-CAN has to be restarted by BFM #25 bit 0 or NMT request Reset Node.

→ **For storing parameters, refer to Subsection 5.6.11**
→ **For module restart (BFM #25 bit 0), refer to Section 6.8**

31...7	6	5	4	3	2	1	0
H0	Stop all nodes	Flying master	Reset all nodes	Start nodes	NMT master start	Start all nodes	NMT master

Bit No.	Item	Description
Bit 0	NMT master	OFF (0): Module is NMT Slave ON (1): Module is NMT Master **Note:** • If it's set to 0, all other settings of Object H1F80 and H1F81 are ignored. • In a CANopen® network, only one (active) NMT Master allowed!
Bit 1	Start all nodes	OFF (0): NMT master sends during the NMT startup the NMT service Start remote node for each assigned NMT slave. The NMT slaves will be started during the NMT startup individually. ON (1): NMT master sends during the NMT startup the NMT service Start all remote nodes. The NMT slaves will be started during the NMT master startup all at the same time. **Notes if setting is ON (1):** • Note Figure 5.2 NMT Master simple startup. • Don't use this setting to start remote nodes which are not assigned to the master via Index H1F81. → **Refer to Subsection 5.8.6**
Bit 2	NMT master start	OFF (0): NMT Master switch during NMT master startup automatically into NMT state Operational ON (1): NMT Master does not switch during NMT master startup automatically into NMT state Operational **Notes if setting is ON (1):** The NMT Master has to be set manually with the SDO write command in the CIF over the Object H1F82 into NMT state Operational. The startup process will be suspended as long as the Device is not set into NMT State Operational. → **Refer to Section 10.2**
Bit 3	Start node	OFF (0): The NMT master shall start the NMT slaves. ON (1): The NMT master shall not start the NMT slaves and the PLC application may start the NMT slaves. **Notes if setting is ON (1):** Note the resulting behaviour shown in Figure 5.2 NMT Master simple startup and Figure 5.3 NMT Slave startup process.
Bit 4	Reset all nodes	OFF (0): In case of error control event of an assigned NMT slave defined as mandatory, the NMT service reset communication with node-ID of the CANopen® device that caused the error control event shall be executed. ON (1): In case of error control event of an assigned NMT Slave defined as mandatory, the NMT service reset communication all Nodes shall be executed. → **Refer to Subsection 5.8.6** **Note:** • In case of optional NMT Slaves, the NMT service reset communication with node-ID of the CANopen® device that caused the error control event will always be executed. • If bit 6 is set to 1, this bit setting will be ignored for mandatory NMT slaves.
Bit 5	Flying master	OFF (0): Do not use Flying master service. ON (1): Use Flying master service **Note:** • If the device loses the Flying Master negotiation, the device works as NMT slave. • If the Flying Master Service is used, all NMT Master in the network need to be set as Flying Master! • If the setting is 1, additional settings need to be considered. → **Refer to Subsection 5.8.11**
Bit 6	Stop all nodes	OFF (0): Do not Stop all nodes in case of an NMT error control event of an assigned Mandatory NMT Slave ON (1): Stop all nodes in case of an NMT error control event of an assigned Mandatory NMT Slave **Note:** • If the setting is 1, the bit 4 setting is ignored. • To restart the network, the NMT master has to be reset manually with BFM #25 bit 0 or with the SDO write command in the CIF over the Object H1F82 into NMT state Reset Communication or Application all Nodes. → **Refer to Section 6.8 and Section 10.2**
Bit 7 to 31	-	

5.8.6 NMT slave startup

If the NMT Master shall startup the NMT Slave, the NMT startup Master uses the Indexes H1F84 to H1F88 to identify the NMT Slaves during Boot-up. The Setting of these Indexes is optional.
The NMT startup Master will request the Index H1000 of the NMT slave to check if the NMT Slave is available in the network. If there is no response on the request, the NMT Master retries every 1s after the request until the NMT Slave responds to the request or the boot time for a mandatory Slave elapses without response.
The Index H1F89 Boot time shall be set to a value which is higher than the maximum NMT startup time of the slowest mandatory slave. This time has to be measured from Power-on/Reset of the NMT master to the point where the last mandatory slave becomes NMT state Operational.
If identification data of NMT Slaves do not match with the setting on the NMT Master, it will result in a termination of the whole NMT Startup process and the NMT startup Master will be disabled.
After a successful Identification, the Configuration Manager configures the NMT Slave at the time when configuration data are stored on the NMT Master.
At last depending on the setting, the NMT Master sets the NMT Slave into NMT state Operational.

→ **For NMT Slave identification, refer to Subsection 5.8.4**
→ **For NMT Master startup process, refer to Figure 5.1**
→ **For Configuration Manager, refer to Subsection 5.8.13**

Note

For correct functioning of the CANopen® network, it is recommended to assign all CANopen® devices which are NMT Slave to the NMT Master.

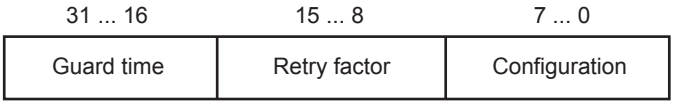
5.8.7 NMT slave assignment

This object configures on the NMT Master for each node-ID (corresponding to the sub-index), the node guarding values and the NMT Slave Configuration. Each sub-index of this object corresponds to the node-ID of a CANopen® device in the network. The sub-index which corresponds to the node-ID of the NMT Master is ignored.

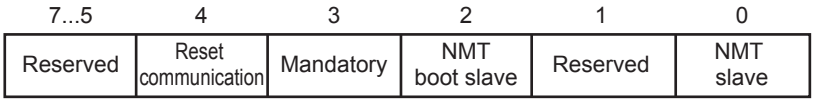
1. Object H1F81 Sub-index H01 to H7F: NMT slave assignment



1) Guard time field:
The value for the guard time indicates the cycle time for node guarding of the CANopen® device. The value is in units of ms. The value 0 disables Node Guarding for the CANopen® device. Bit 0 in the Configuration field and the Retry factor needs to be set also to enable node guarding. If the heartbeat consumer object is configured to a value ≠ 0, then the heartbeat mechanism will have priority over node guarding.
Setting range: K0 to K65535

2) Retry factor field
The value for the retry factor indicates the number of retries the NMT master issues in case of a Node Guarding event. The value 0 disables Node Guarding for the CANopen® device. Bit 0 in the Configuration field and the Guardtime needs to be set also to enable node guarding.
Setting range: K0 to K255

3) Configuration field:



Bit No.	Item	Description
Bit 0	NMT slave	OFF (0): Remote Node is NMT Master or not assigned. ON (1): Remote Node is NMT Slave and assigned to this NMT Master. **Note:** • It's mandatory to set this bit if the NMT Master shall startup and/or Node guard the NMT Slave. • If the Flying Master Service is used, it shall be considered as Flying Master switching into NMT Slave mode if they are not the active NMT Master and may need to be startup by the active NMT Master. → **Refer to Subsection 5.8.11**
Bit 2	NMT boot slave	OFF (0): Configuration and NMT service Start remote node are not allowed in case of error control event or NMT service Boot up. ON (1): Configuration and NMT service Start remote node execute in the case of error control event or NMT service Boot up. → **Refer to Subsection 5.8.1, 5.8.2 and 5.8.13**
Bit 3	Mandatory	OFF (0): CANopen® device may be present prior to network start up (CANopen® device is optional) ON (1): CANopen® device is present prior to network start up (CANopen® device is mandatory) **Note:** • For mandatory slaves consider at Object H1F80 also the bits 4 and 6 → **Refer to Subsection 5.8.5** • For LSS Slave this bit has to be set to 1 to enable LSS service for this NMT Slave.

Bit No.	Item	Description
Bit 4	Reset communication	OFF (0): NMT service Reset communication may be executed for the CANopen® device at any time ON (1): NMT service Reset communication is not executed for the CANopen® device in case the CANopen® device is in NMT state Operational **Note when using this function:** • If the Flying Master Service is used in the Network, there will be an all Node Reset communication command executed during the Flying Master negotiation Process • If no Heartbeat consuming is configured for this node, the NMT startup Master starts with Node Guarding, which has to be answered within 100ms. • In the case that no Heartbeat is used or supported, confirm that the NMT Slave supports Node guarding. • Take care that the NMT Master is also configured for Node Guarding if the NMT Slave is configured for life guarding of the NMT Master. Otherwise the NMT Slave will go in an NMT error state. • If within the Heartbeat consuming time no Heartbeat is received or no Node Guard confirmation is received after the Node Guarding RTR message, the NMT Slave startup ends with an error.
Bit 1, Bit 5 to 7	Reserved	Default value: 0. If set to ON (1), FX3U-CAN will respond with SDO access error.

2. Object H1F89 : Boot time

The object defines the time out in ms between start of the process Start process boot NMT slave and signalling of successful boot of all mandatory NMT slaves. If the Boot time elapses before all mandatory Slaves are started, the NMT startup will be stopped and the NMT startup Master will be disabled.
The value 0 disables the timer.
Setting range: K0 to K4,294,967,295

3. Object H102A: NMT inhibit time

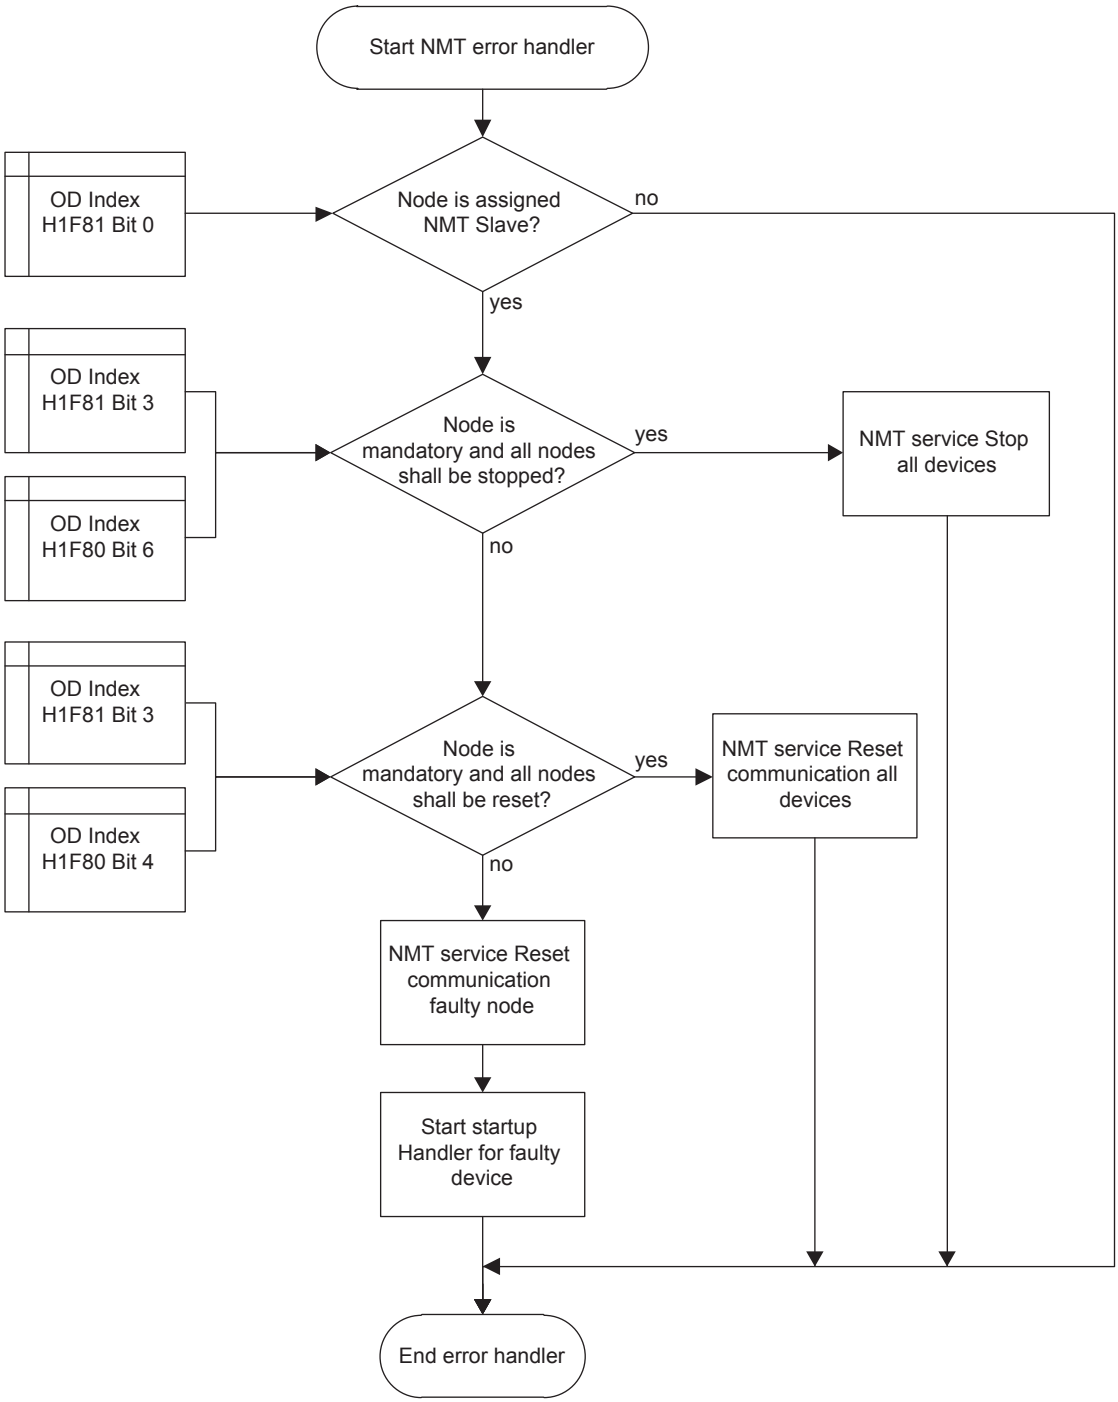
This object configures the minimum time between two NMT messages. The 16bit value is given in multiples of 100 µs (Lowest counting resolution of FX3U-CAN: 1ms). The value 0 disables the inhibit time.
Setting range: In the FX3U-CAN, the value is fixed to 0.

5.8.8 NMT Bootup / Error Event handling

When Consumer Heartbeat time elapses, Node Guarding failed or the NMT Slave responds a unexpected Node state, the NMT Master handles the NMT Slave as shown in Figure 5.4.
If the NMT Master receives at any time a Boot-Up message from an assigned NMT Slave, the NMT Slave will be startup by the NMT startup Master. If the NMT Master is in NMT state stopped, the NMT startup Master will not be able to start the NMT Slave.

→ **For protocol boot-up, refer to Subsection 5.8.2**

Figure 5.4: NMT error handler



5.8.9 Request NMT

This object indicates at the NMT Master the current NMT state of a unique CANopen® device in the network. The sub-index corresponds to the node-ID of the CANopen® devices in the network. The sub-index H80 represents all nodes. Only the NMT Master is allowed to send NMT node control messages.
The NMT state is shown in BFM #601 to #727.
At the NMT Master, an NMT message can be requested can be via an SDO write access. Consider using this carefully because the NMT Startup Master will not set the Target Node automatically back to Operational until the next reset if the request is a Stop or Pre-Operational request!

→ **For the BFM assignment corresponding to the NMT state of each node, refer to Section 6.22**

Note

If a Node for Heartbeat consuming is activated and a boot-up Message is received from this node, the NMT state Pre-operational will be displayed for this node until the next Heartbeat is received for this node.

Object H1F82 Sub-index H01 to H80: Request NMT

Value (hex)	Description	
	SDO read	SDO write
00	NMT state unknown	Reserved
01	CANopen® device missing	Reserved
02 to 03	Reserved	
04	NMT state Stopped	NMT service Stop remote node
05	NMT state Operational	NMT service Start remote node
06	Reserved	NMT service Reset node
07	Reserved	NMT service Reset communication
08 to 7E	Reserved	
7F	NMT state Pre-operational	NMT service Enter pre-operational
80 to 83	Reserved	
84	Reserved	NMT service Stop remote node excluding NMT master With this Value the NMT Slave will be set into the requested NMT State Stopped, but the NMT Master will stay in its current NMT State.
85	Reserved	NMT service Start remote node excluding NMT master With this Value the NMT Slave will be set into the requested NMT State Operational, but the NMT Master will stay in its current NMT State.
86	Reserved	NMT service Reset node excluding NMT master With this Value the NMT Slave will be set into the requested NMT State Reset Node, but the NMT Master will stay in its current NMT State.
87	Reserved	NMT service Reset communication excluding NMT master With this Value the NMT Slave will be set into the requested NMT State Reset communication, but the NMT Master will stay in its current NMT State.
88 to 8E	Reserved	
8F	Reserved	NMT service Enter Pre-operational excluding NMT master With this Value the NMT Slave will be set into the requested NMT State Pre-operational, but the NMT Master will stay in its current NMT State.
90 to FF	Reserved	

5.8.10 Request node guarding

This object indicates the node guarding state for a unique CANopen® device in the network. The sub-index corresponds to the node-ID of the CANopen® devices in the network. The sub-index H80 represents all nodes.

Note

If Node Guarding is not set, then Node Guarding will not start.

Object H1F83 Sub-index H01 to H80: Request node guarding

Value (hex)	Description	
	Read	Write
00	Node guarding stopped	Stop node guarding
01	Node guarding started	Start node guarding
02 to FF	Reserved	

5.8.11 Flying Master

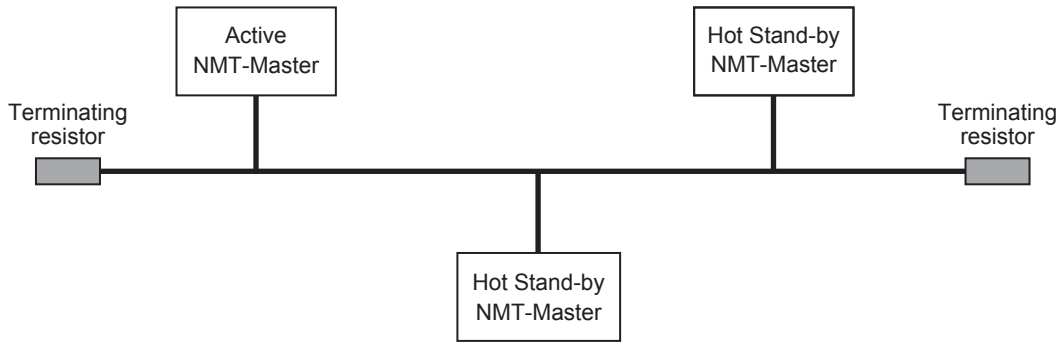
The Flying Master mechanism provides services for a hot stand-by NMT Master within a CANopen® network. All Flying Masters shall monitor the Heartbeat of all masters in the network. A new negotiation is automatically started if the active master fails. The master with the highest priority and the lowest node-ID wins the negotiation. A new negotiation is started when a new NMT master with a higher priority than the active NMT Master join the network. The Flying NMT master priority is defined by (NMT master priority level × 128 + Node-Id), the lower value has the higher priority.
BFM #25 bit 15 indicates if the module is the current NMT Master.

Note

- If the module has enabled the Flying Master function and no Heartbeat producing is set, the Heartbeat producing is automatically set to 1000 ms.
- If the module loses the negotiation and no Heartbeat consuming is set for the active NMT master, Heartbeat consuming is automatically set to (1500 + 10 × Node-ID) ms.
- If the Heartbeat producing and consuming is set manually, set a different value for the consuming time of one Node-ID on the other Flying masters so that multiple masters will not initiate at the same time a new Flying master negotiation when the active NMT master times out.
- If a Flying Master is in the Network which is not a FX3U-CAN, ensure that this node has Heartbeat producing enabled, otherwise the FX3U-CAN with activated Flying Master function will send endless Reset Communication NMT Messages!

  → **For the Communication Status (BFM #25), refer to Section 6.8**
- All Flying Masters should have the same configuration for the Slaves.
- Configure in the Flying master negotiation response wait time of all Flying Master.
  Formula for the Flying Master negotiation response wait time:

  Flying Master negotiation response wait time =
  (NMT master priority) × (Priority time slot) + (Node-ID) × (Node time slot)
- During the Flying master negotiation process, an NMT service Reset communication message will be sent to all nodes.

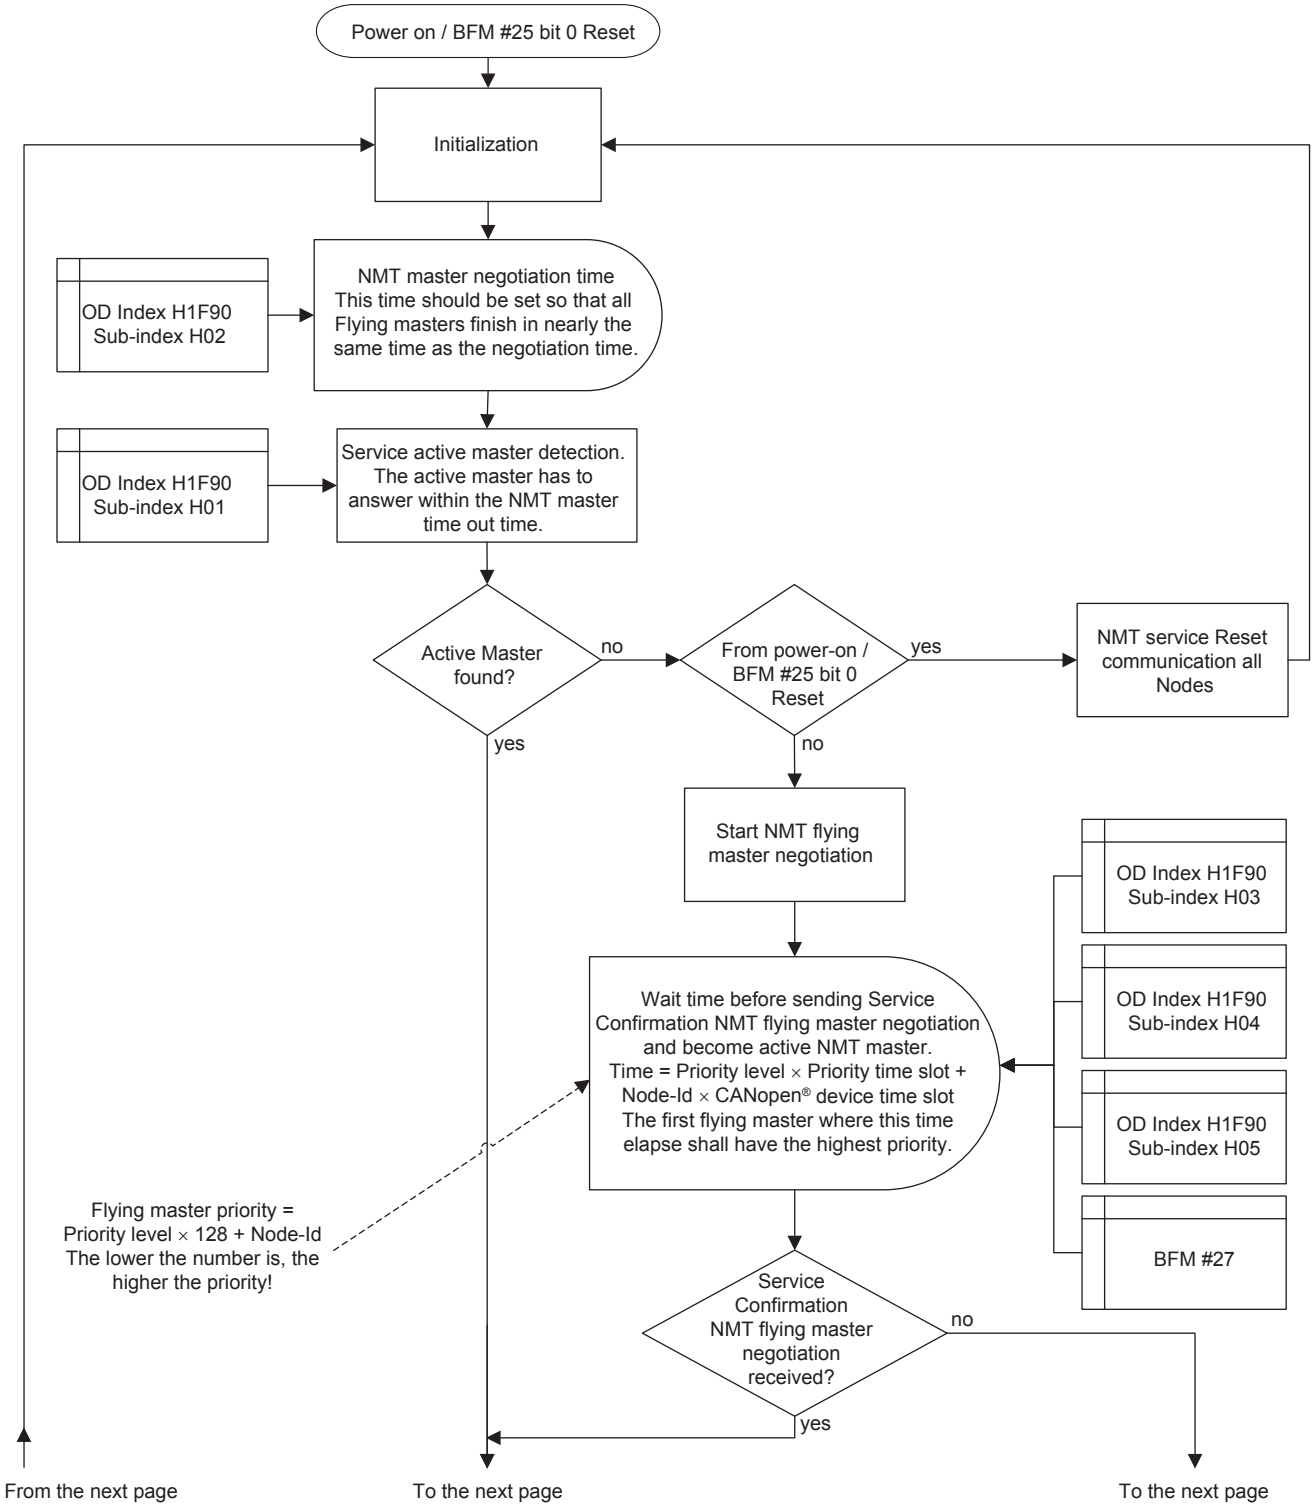


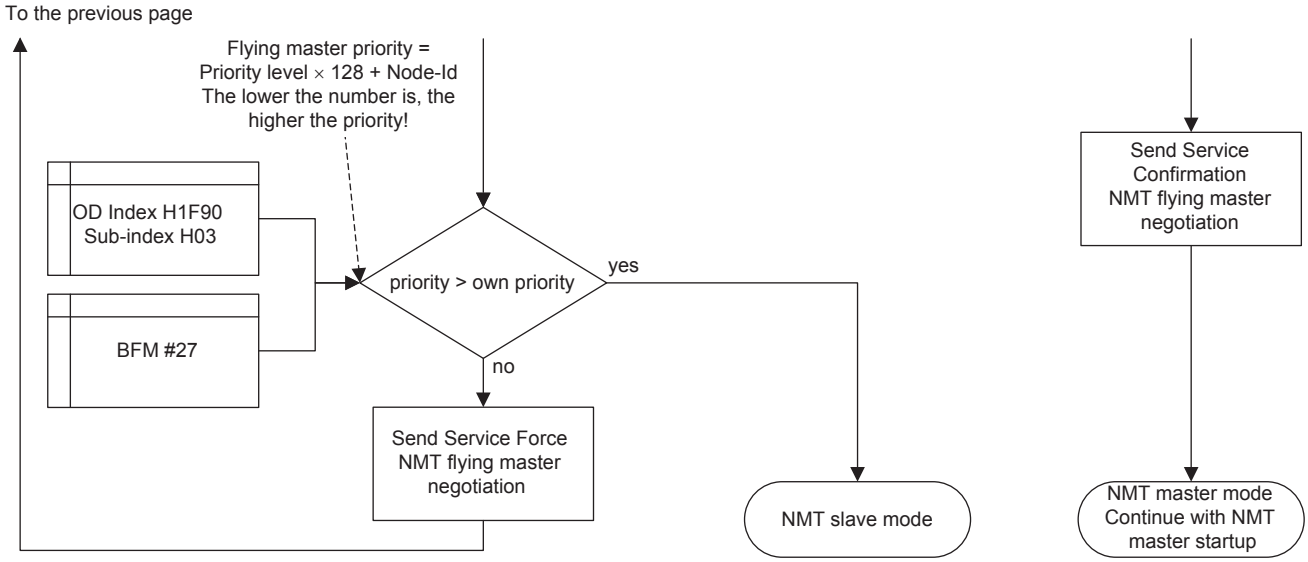
Point

When using the Flying Master function, please consider the following points:

- The Network communication will be reset after the Active NMT Master fails which will result in an Interruption of the System Application.
- Application data will be not synchronized by the Flying Master mechanisms. This has to be handled by a proper CANopen® configuration and CANopen® system planning.
- Be careful with the setting of the NMT flying master timing parameters. An inappropriate setting will result in a Malfunction of the Flying Master negotiation. Test the System Configuration before field use.

Figure 5.5: NMT flying master process





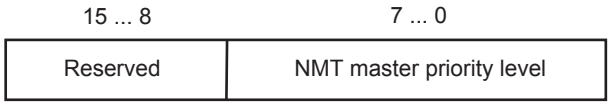
1. **Object H1F80: NMT startup**
   Set H1F80 bit 5 to ON to participate in NMT flying master negotiation.
   → **For NMT startup, refer to Subsection 5.8.5**

2. **Object H1F90: NMT flying master timing parameter**
   This object defines the parameters for the NMT flying master negotiation process.

3. **Object H1F90 Sub-index H01: NMT master timeout**
   The value is in units of ms.

4. **Object H1F90 Sub-index H02: NMT master negotiation time delay**
   The value is in units of ms.

5. **Object H1F90 Sub-index H03: NMT master priority**



Value (hex)	Description
0000	Priority high
0001	Priority medium
0002	Priority low
0003 to FFFF	Reserved

6. **Object H1F90 Sub-index H04: Priority time slot**
   The value is in units of ms.

   Formula for the Priority time slot:
   Priority time slot > 127 × {CANopen® device time slot (Sub-index H05)}

7. **Object H1F90 Sub-index H05: CANopen® device time slot**
   The value is in units of ms.

8. **Object H1F90 Sub-index H06 Multiple NMT master detect cycle time**
   The value is in units of ms.

5.8.12 LSS

The FX3U-CAN uses the layer setting services and protocols, to configure via the CAN network the Baud Rate and the Node Address of an LSS slave device that is sealed against harsh environments and that does not have any hardware components like DIP-switches for setting the node-ID or bit timing parameters.

Within a CANopen® network, only one LSS-Master is allowed to exist. For the LSS-Master Mode the module has to be the active NMT-Master.

To activate the LSS Master, configure in the Object dictionary:

- Index H1F89:
  The Boot time out. The time shall be longer than the boot time of the NMT-Client, which needs the longest time for boot-up (Power On until Boot-up message).
- Indexes H1F84 to H1F88, the Sub-index which corresponds to the Node-Id which shall be set at the LSS-Client:
  The Identification information which is available at the Object dictionary Indexes H1000 and H1018 at the LSS-Client.
- Index H1F81, the Sub-index which corresponds to the Node-Id which shall be set at the LSS-Client:
  Set bit 0 NMT Slave, bit 2 NMT boot slave and bit 3 Mandatory device.

If the LSS Slave is not found on the configured baud rate, the FX3U-CAN changes automatically the baud rate to find the LSS Slave. Through communication with a different baud rate, it can come to a Bus off condition at the other devices in the network. If the device does not support automatically recovering from Bus off or needs too much time for recovering, it's not possible to configure the LSS-Client.

It is recommended to establish a Point to Point connection for the configuration and to delete the Serial number entry (Index H1F88) after configuration to prevent an unwanted start of the LSS Master.

→ **For Boot time, refer to Object Dictionary Index H1F89 in Section 5.6**
→ **For NMT slave identification, refer to Object Dictionary Index H1F84 to H1F88 in Subsection 5.8.4**
→ **For configuration, refer to Object Dictionary Index H1F81 in Subsection 5.8.7**

Note

Check if the LSS-Client has activated an internal Bus termination. If necessary, deactivate the Bus termination first to prevent unwanted behaviour of the connected nodes on the bus.

5.8.13 Configuration manager

The Configuration manager provides mechanisms for configuration of CANopen® devices in a CANopen® network. For saving and requesting the CANopen® device Configuration, the following Objects are used.

The sub-indexes are according to node-ID. The Configuration manager can be only used on the active NMT Master.

Note

If during the Configuration upload to the NMT slave a failure other than SDO access failure at read only Indexes and Sub indexes occurs, the configuration will be stopped.

1. Object H1020: Verify configuration

This object indicates the downloaded configuration date and time on the NMT Slave. A configuration manager uses this object to verify the configuration after a reset to check if a reconfiguration is necessary. If on a NMT Slave the Object dictionary configuration is changed, the Sub-indexes H01 and H02 values will be set to H0. At the time of NMT Slave boot-up, the Configuration manager compares the corresponding entries of H1020 on the Slave with its own setting in the Indexes H1F26 and H1F27 (see below) and decides if a reconfiguration is necessary or not. This mechanism reduces the time of NMT Slave bootup.
Sub-index H01: Configuration date; contains the number of days since 1984-01-01.
Sub-index H02: Configuration time; contains the number of ms after midnight.

2. Object H1F22 Sub-index H01 to H7F: Concise DCF

These objects save a configuration file with the Concise DCF format into the node-ID corresponding sub-index. A CANopen® configuration software and a CAN-Bus PC-Interface is necessary for the generation of a CANopen® configuration and saving over the CAN Bus.
Up to 60 Concise DCFs can be stored on the FX3U-CAN. The maximum size for each entry is 65531 byte.

Note

- To delete a Sub-index entry write "0" to this Sub-index. Erasing an entry requires 2 to 10 seconds. During this time, it is not possible to write a new file.
  If the Flash ROM is busy, an SDO write access error H06060000 will occur.
- When the FX3U-CAN responds to an SDO write access to a Sub-index with SDO Error H06010002, this Sub-index already had been used. Delete the Sub-index entry by using the aforesaid method.
- When the FX3U-CAN responds to an SDO write access to a Sub-index with SDO access Error H06070010, the CDCF File is bigger than 65531 bytes, or this Sub-index has already been used. Check the File size and delete the Sub-index entry by using the aforesaid method.
- If the used CANopen® configuration Software has a problem with the automatic transfer of the Concise DCF be cause of Flash ROM busy errors, please use the selective download of the files if supported.
- All H1F22 Sub-indexes can also be deleted by the Restore default parameter command.
- Self-configuration over the Sub-Index of the entry corresponding to own Node-Id is not supported.
- The Concise DCF data will be directly stored on the Flash ROM. A Store parameters command over Object Dictionary Index H1010 is not necessary (Refer to Section 4.6.11).

→ **For Store parameters, refer to Subsection 5.6.11**
→ **For Restore default parameters, refer to Subsection 5.6.12**

3. Object H1F25 Sub-index H01 to H80: Configuration request

To initiate a configuration request for a CANopen® node, use the SDO write command in the CIF and write H666E6F63 (ISO8859 String code: "conf") to the corresponding sub-index of the FX3U-CAN. The sub-index H80 initiates a configuration request for all CANopen® devices in the network for which CDCF data are stored. A configuration request to the self node-ID will be ignored and no error response will be generated.
For Sub-index H01 to H7F, a SDO failure H08000024 will occur if no data are stored for this Node-Id.
A configuration request to the Sub-index of the entry corresponding to own Node-Id will be ignored.

→ **For SDO write command in the CIF, refer to Subsection 10.2.3**

4. Object H1F26 Sub-index H01 to H7F: Expected configuration date

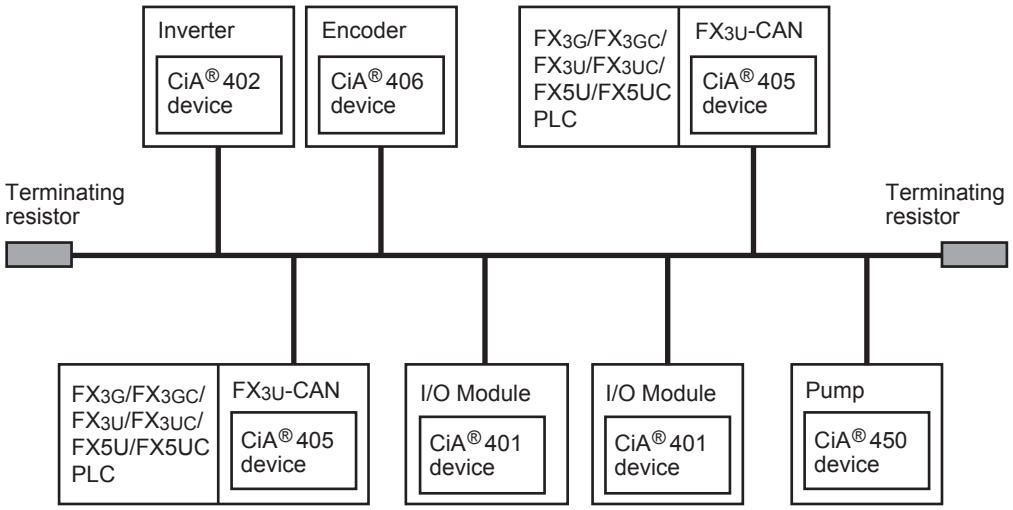
This object is used by CANopen® configuration software for verification of the configuration date of the CANopen® devices in the network. The value contains the number of days since 1984-01-01.

5. Object H1F27 Sub-index H01 to H7F: Expected configuration time

This object is used by CANopen® configuration software for verification of the configuration time of the CANopen® devices in the network. The value contains the number of ms after midnight.

5.9 Device Profile CiA® 405 V2.0 for IEC 61131-3 Programmable Devices

This section describes the Device Profile for IEC 61131-3 programmable devices. The objects for data read/write support signed 8bit, unsigned 8bit, signed 16bit, unsigned 16bit, signed 32bit, unsigned 32bit and float 32bit. The corresponding Objects in the Object dictionary can be directly accessed via the BFM from the PLC.
→ **Refer to Section 7.1**



The table below provides a brief description and reference information for the FX3U-CAN CANopen® Object Dictionary.

Index (hex)	Sub-index (hex)	Object	Description	Data type	Initial value	Read/ Write
A000	00	Input network variables	Highest sub-index	U8	HF0	R
	01 to F0		Signed Integer 8 bit	I8	K0	R
A001	00	Input network variables	Highest sub-index	U8	HF0	R
	01 to F0		Signed Integer 8 bit	I8	K0	R
A002	00	Input network variables	Highest sub-index	U8	HA0	R
	01 to A0		Signed Integer 8 bit	I8	K0	R
A040	00	Input network variables	Highest sub-index	U8	HF0	R
	01 to F0		Unsigned Integer 8 bit	U8	K0	R

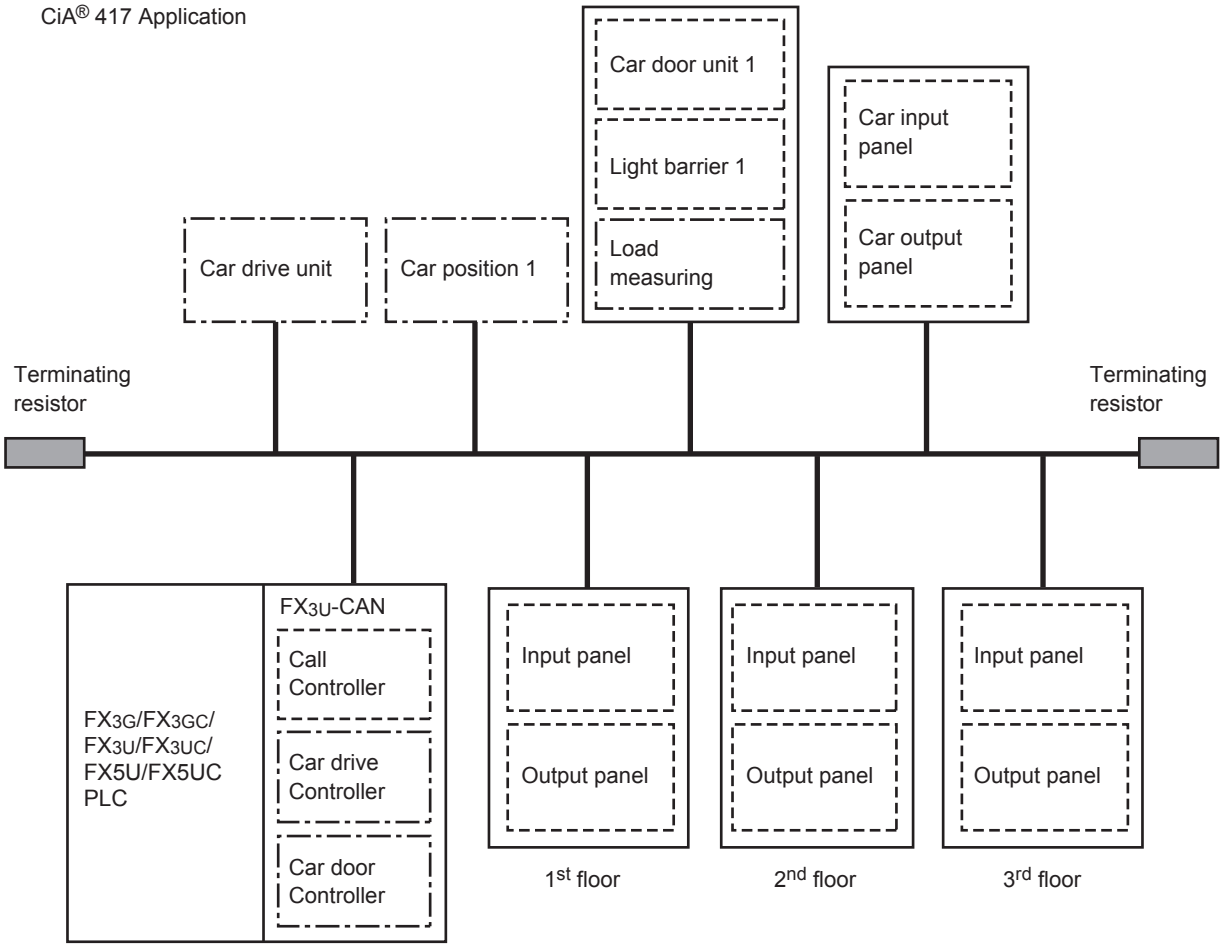
	01 to A0		Float 32 bit	Real32	K0	R/W

5.10 Application Profile CiA® 417 V2.1 for Lift Control Systems

This application profile describes the virtual devices (hereinafter called VD) of lift control systems. The virtual controllers (e.g. call, car door, and car drive controller) perform dedicated control functions of the lift application. The virtual units (e.g. input and output panels, car door, light barrier, car position, car drive, load-measuring) are implemented each in single CANopen® devices or combined in one or more CANopen® devices. The FX3U-CAN implements the VD call controller, car drive controller and the car door controller.
The VD Call controller receives all call requests from these VD input panels, and transmits the corresponding acknowledgements to the VD output panels. The VD car door controller transmits commands to the VD car door unit and the VD light barrier unit. The VD car driver controller transmits commands to the VD car drive unit. It receives status information from the VD car drive unit and the VD load-measuring unit. If the profile position mode is used, additional status information from the VD car position unit is needed. It is recommended to give the Call controller the lowest node-ID.
The lift control system application profile shares the Object Dictionary area from H6000 to H9FFF. The area from H6000 to H60FF is related to the CANopen® device and not to one of the lift-control applications. The area from H6100 to H62FF is related to the VD input panel units, they do not belong to a specific lift control.
The Indexes H6010 and H6011 are related to the VD Call controller and do not belong to a specific lift control.
It is possible to realize up to 8 lift-control applications. For the specific lift control application 1, the area H6200 to H67FE is used. For other lift control applications, the area H6200 to H67FE is shifted as follows:

- H6200 to H67FE lift control application 1
- H6A00 to H6FFE lift control application 2
- H7200 to H77FE lift control application 3
- H7A00 to H7FFE lift control application 4
- H8200 to H87FE lift control application 5
- H8A00 to H8FFE lift control application 6
- H9200 to H97FE lift control application 7
- H9A00 to H9FFE lift control application 8



The table below provides a brief description and reference information for the FX3U-CAN CANopen® Object Dictionary.

Note: Stored to Flash ROM

Data will be saved to the Flash ROM by using the Store Parameter command in Index H1010. Be careful with write handling. The maximum number of writes to the built-in flash ROM is 10,000 times.

Index (hex)	Sub-index (hex)	Object	Description		Data type	Initial value	Read/ Write	Stored to Flash ROM

5.10.1 Lift number

This Object contains the lift number to which the FX3U-CAN is assigned.
The Bit for the assigned lift number is set to ON (1).

7	6	5	4	3	2	1	0
Lift 8	Lift 7	Lift 6	Lift 5	Lift 4	Lift 3	Lift 2	Lift 1

5.10.2 Virtual input mapping

This Object contains the last received input data from one of the digital input panel group objects.

47 ... 40	39 ... 32	31 ... 24	23 ... 16	15 ... 8	7 ... 0
Function data	Door	Floor	Lift	Sub-function	Basic function

1. Basic function field

Bit 0 to 7 Value (hex)	Description
00	Reserved
01	Generic input
02	Standard hall call request
03	Low priority hall call request
04	High priority hall call request
05	Standard car call request
06	Low priority car call request
07	High priority car call request
08	Standard destination call
09	Low priority destination call
0A	High priority destination call
0B	Standard call to destination floor
0C	Low priority call to destination floor

Bit 0 to 7 Value (hex)	Description
0D	High priority call to destination floor
0E	Special function
0F	Access code upload request
10	Speech connection request
11	Area monitoring connection request
12	Fire detector
13 to 15	Reserved
16	Status of safety-related circuitries (This is not safety-related information.)
17 to 1F	Reserved
20	Guest call
21 to 7F	Reserved
80 to FF	Manufacturer-specific

2. Sub-function field

The Sub-function field is interpreted differently depending on the basic function field value.

Basic function field Bit 0 to 7 value (hex)	Sub-function field Bit 8 to 15 value (hex)	Description
01	00	Reserved
	01	Generic input 1
	⋮	⋮
	FE	Generic input 254
	FF	Reserved
02 to 04	00	Reserved
	01	Hall call up
	02	Hall call down
	03	Hall call
	04	Hall call extra up
	05	Hall call extra down
	06	Hall call extra
	07 to FF	Reserved
05 to 0D	00	Reserved
	01 to FE	Floor number 1 to 254
	FF	Reserved
0E	00	Reserved
	01	Request fan 1
	02	Request fan 2
	03	Request load time 1
	04	Request load time 2
	05	Key lock 1
	06	Key lock 2
	07	Key lock 3
	08	Key lock 4
	09	Request door open
	0A	Request door close
	0B	Fire recall (key switch hall panel)
	0C	Fire service (key switch car panel)
	0D	Hall call disable
	0E	Attendant service
	0F	VIP service
	10	Out of order
	11	Bed passenger service

Basic function field Bit 0 to 7 value (hex)	Sub-function field Bit 8 to 15 value (hex)	Description
0E	12	Special service
	13	Service run
	14	Dogging service enable
	15	Dogging service up
	16	Dogging service down
	17	Fire alarm (external fire alarm system)
	18	Provide priority
	19	Lift attendant start button
	1A	Lift attendant drive through button
	1B	Security run
	1C	Second call panel
	1D	Door enable
	1E	Call cancel button fire operation
	1F	Fire alarm reset
	20	Body detector (e.g. person in car)
	21	Earthquake detector
	22 to FF	Reserved
0F to 11	00 to FF	Reserved
12	00	Reserved
	01 to FE	Fire detector 1 to 254
	FF	Reserved
13 to 15	00 to FF	Reserved
16	00	Reserved
	01 to 03	Safety-related circuitry 1 to 3
	04	Hall/swing door
	05	Car door
	06	Door lock
	07 to FF	Reserved
17 to 1F	00 to FF	Reserved
20	00	Reserved
	01 to FE	Guest call 1 to 254
	FF	Reserved
21 to 7F	00 to FF	Reserved
80 to FF	00 to FF	Manufacturer-specific

3. Lift field

The Bit for the requested lift number is set to ON (1).

23	22	21	20	19	18	17	16
Lift 8	Lift 7	Lift 6	Lift 5	Lift 4	Lift 3	Lift 2	Lift 1

4. Floor field

Bit 24 to 31 Value (hex)	Description
00	Car panel
01 to FE	Panel of floor 1 to 254
FF	Reserved

5. Door field

This value provides the door number to which the sending virtual device is assigned. The structure of the field depends on the value of the basic function field.

- When the basic function field is H08 to H0D, the structure of the door field is shown below:

39	38	37	36	35	34	33	32
Destination door 4	Destination door 3	Destination door 2	Destination door 1	Source door 4	Source door 3	Source door 2	Source door 1

- When the basic function field is H00 to H07 or H0E to HFF, the structure of the door field is shown below:

39 ... 36	35	34	33	32
H0	Door 4	Door 3	Door 2	Door 1

6. Function data field

The function data provides the input state of a virtual input.

47	46 ... 42	41 ... 40
lock	Reserved	Input state

Bit No.	Item	Description
Bit 40 and 41	Input state	Bit 41 / Bit 40 / Description: OFF (0) / OFF (0) / Input state is OFF. OFF (0) / ON (1) / Input state is ON. ON (1) / OFF (0) / Function is defective ON (1) / ON (1) / Function is not installed
Bit 42 to 46	Reserved	
Bit 47	lock	OFF (0): Button or key-button has no locking function ON (1): Button or key-button has locking function

5.10.3 Virtual output mapping

This Object contains the output data for one of the digital output group objects.

47 ... 40	39 ... 32	31 ... 24	23 ... 16	15 ... 8	7 ... 0
Function data	Door	Floor	Lift	Sub-function	Basic function

1. Basic function field

Bit 0 to 7 Value (hex)	Description
00	Call controller commands
01	Generic output
02	Standard hall call acknowledgement
03	Low priority hall call acknowledgement
04	High priority hall call acknowledgement
05	Standard car call acknowledgement
06	Low priority car call acknowledgement
07	High priority car call acknowledgement
08	Standard destination call acknowledgement
09	Low priority destination call acknowledgement
0A	High priority destination call acknowledgement
0B	Standard call to destination floor acknowledgement
0C	Low priority call to destination floor acknowledgement
0D	High priority call to destination floor acknowledgement
0E	Special function acknowledgement
0F	Access code upload acknowledgement
10	Speech connection acknowledgement
11	Area monitoring connection acknowledgement
12 to 1F	Reserved
20	Guest call acknowledgement
21 to 3F	Reserved
40	Position indication
41	Hall lantern
42	Direction indication
43	Special indication
44	Arrival indication
45	Operation data
46	Publicity indication
47	Speech synthesis
48 to 49	Reserved
4A	Miscellaneous outputs
4B to 7F	Reserved
80 to FF	Manufacturer-specific

2. Sub-function field

The Sub-function field is interpreted differently depending on the basic function field value.

Basic function field Bit 0 to 7 value (hex)	Sub-function field Bit 8 to 15 value (hex)	Description
00	00	Reserved
	01	Request all active hall calls
	02	Request all special inputs (basic functions 0E and 12)
	03 to FF	Reserved
01	00 to FF	Reserved
02 to 04	00	Reserved
	01	Hall call up acknowledgement
	02	Hall call down acknowledgement
	03	Hall call acknowledgement
	04	Hall call extra up acknowledgement
	05	Hall call extra down acknowledgement
	06	Hall call extra acknowledgement
	07 to FF	Reserved
05 to 0D	00	Reserved
	01 to FE	Target stop acknowledgement 1 to 254
	FF	All target stop buttons
0E	00	Reserved
	01	Request fan 1 acknowledgement
	02	Request fan 2 acknowledgement
	03	Request load time 1 acknowledgement
	04	Request load time 2 acknowledgement
	05	Request key lock 1 acknowledgement
	06	Request key lock 2 acknowledgement
	07	Request key lock 3 acknowledgement

<table>
<tr><th>Basic function field Bit 0 to 7 value (hex)</th><th>Sub-function field Bit 8 to 15 value (hex)</th><th>Description</th></tr>
<tr><td rowspan="30">0E</td><td>08</td><td>Request key lock 4 acknowledgement</td></tr>

Basic function field Bit 0 to 7 value (hex)	Sub-function field Bit 8 to 15 value (hex)	Description
43	05	Fire brigade service
	06	Help is coming
	07	Special service
	08	Load time
	09	Occupied
	0A	Out of order
	0B	Close door
	0C	Case of fire
	0D	Hall call disable
	0E	Travel to evacuation floor
	0F	Travel to fire recall floor
	10 to FF	Reserved
44	This sub-function shows the arrival indication up/down. 15 ... 10 | 9 | 8 H0 | Down | Up OFF (0): Not arrived ON (1): Arrived	
45 to 46	00 to FF	Reserved
47	00	Switch off speech synthesis on all output panels
	01 to FE	Announce floor number 1 to 254
	FF	Announce current floor number
48 to 49	00 to FF	Reserved
4A	00	Reserved
	01	Hall call enable
	02	Lift operational
	03 to FF	Reserved
4B to 7F	00 to FF	Reserved
80 to FF	00 to FF	Manufacturer-specific

3. Lift field

This value provides the lift number or the group of lifts, to which the output is assigned.

23	22	21	20	19	18	17	16
Lift 8	Lift 7	Lift 6	Lift 5	Lift 4	Lift 3	Lift 2	Lift 1

4. Floor field

Bit 24 to 31 Value (hex)	Description
00	Car panel
01 to FE	Floor number 1 to 254
FF	All floor panels

5. Door field

This value provides the door number to which the output is assigned. The structure of the field depends on the value of the basic function field. If the bits of the door field are set to 1, this shall indicate an assignment of the output to this door.

- When the basic function field is H08 to H0D, the structure of the door field is shown below:

39	38	37	36	35	34	33	32
Destination door 4	Destination door 3	Destination door 2	Destination door 1	Source door 4	Source door 3	Source door 2	Source door 1

- When the basic function field is H00 to H07 or H0E to HFF, the structure of the door field is shown below:

39 ... 36	35	34	33	32
H0	Door 4	Door 3	Door 2	Door 1

6. Function data field

The function data provides the input state of a virtual input.

47	46 ... 44	43 ... 41	40
Predicate	Property parameter	Property	Status

Bit No.	Item	Description
Bit 40	Status	OFF (0): No data indicated (Does not apply for basic function H40) ON (1): Data indicated
Bit 41 to 43	Property	**Bit 41 to 43 value (hex)** H0: No action (default) H1: Output continuously H2: Output pulsed H3: Output flashing H4: Output coloured H5: Output with volume H6: Output with scroll rate H7: Reserved
Bit 44 to 46	Property parameter	Refer to table below
Bit 47	Predicate	OFF (0): Acknowledgement is not affirmed ON (1): Acknowledgement is affirmed

Value definition of the property parameter field (Bit 44 to 46)

Bit 44 to 46 value (hex)	Description						
	No action	Continuous	Pulsed	Flashing	Colour	Volume	Scroll rate
0	No action	Reserved	< 0.5 s	10 Hz	White	Minimum	Automatic
1			1 s	7.5 Hz	Yellow	Vary	1 line/s
2			1.5 s	5 Hz	Reserved	Vary	2 line/s
3			2 s	2 Hz	Green	Vary	3 line/s
4			3 s	1. 5Hz	Reserved	Vary	4 line/s
5			5 s	1 Hz	Red	Vary	5 line/s
6			10 s	0.5 Hz	Reserved	Vary	6 line/s
7			> 15 s	0.25 Hz	Blue	Maximum	7 line/s

5.10.4 Door control word

This Object contains the door commands and other control data.

15 ... 12	11 ... 10	9 ... 8	7 ... 6	5 ... 4	3 ... 2	1 ... 0
Command	Door velocity	Motion detector	Finger protector	Door lock	Battery power	H3

1. Battery power field

Bit 2 to 3 Value (hex)	Description
0	Battery power supply disabled
1	Battery power supply enabled
2	Reserved
3	Do not care / take no action

2. Door lock field

Bit 4 to 5 Value (hex)	Description
0	Enable door lock
1	Disable door lock
2	Reserved
3	Do not care / take no action

3. Finger protector field

Bit 6 to 7 Value (hex)	Description
0	Enable finger protector
1	Disable finger protector
2	Reserved
3	Do not care / take no action

4. Motion detector field

Bit 8 to 9 Value (hex)	Description
0	Enable motion detector
1	Disable motion detector
2	Reserved
3	Do not care / take no action

5. Door velocity field

Bit 10 to 11 Value (hex)	Description
0	Move door with standard speed
1	Move door with reduced speed
2	Reserved
3	Do not care / take no action

6. Command field

Bit 12 to 15 Value (hex)	Description
0	Close door without limit force (Not allowed for EN-81 compliant lifts)
1	Close door with limit force
2	Nudging (Forced closing of car door with reduced speed without reversal devices due to the door being blocked for too long)
3	Open door without limit force (Not allowed for EN-81 compliant lifts)
4	Open door with limit force
5	Reserved
6	Reserved
7	Stop door without torque
8	Stop door with torque
9 to C	Reserved
D	Tech-in drive
E	Reset door
F	Do not care / take no action

5.10.5 Door status word

This Object contains the car door status and other status information.

15 ... 12	11 ... 10	9 ... 8	7 ... 6	5 ... 4	3 ... 2	1 ... 0
Status	Force limit	Motion detector	Finger protector	Door lock	Battery power	Safety contact

1. Safety contact field

Bit 0 to 1 Value (hex)	Description
0	Contact not closed
1	Contact closed
2	Error indicator
3	Not available or not installed

2. Battery power field

Bit 2 to 3 Value (hex)	Description
0	No battery power used
1	Battery power used
2	Error indicator
3	Not available or not installed

3. Door lock field

Bit 4 to 5 Value (hex)	Description
0	Door not locked
1	Door locked
2	Error indicator
3	Not available or not installed

4. Finger protector field

Bit 6 to 7 Value (hex)	Description
0	No finger detected
1	Finger detected
2	Error indicator
3	Not available or not installed

5. Motion detector field

Bit 8 to 9 Value (hex)	Description
0	Motion not detected
1	Motion detected
2	Error indicator
3	Not available or not installed

6. Force limit field

Bit 10 to 11 Value (hex)	Description
0	Force limit not reached
1	Force limit reached
2	Error indicator
3	Not available or not installed

7. Status field

Bit 12 to 15 Value (hex)	Description
0	Door closed with torque
1	Door closed without torque
2	Door is closing
3	Door opened with torque
4	Door opened without torque
5	Door is opening
6	Door is re-opening
7	Door stopped with torque (not in an end position)
8	Door stopped without torque (not in an end position)
9 to C	Reserved
D	Tech-in drive
E	Error indicator
F	Not available or not installed

Note

If the door is in an open or closed end position, this shall have higher priority than stopped status.

5.10.6 Light barrier status

This Object contains the status information of the VD light barrier unit for up to four doors.

7 ... 6	5 ... 0
Status	H3F

Bit 6 to 7 Value (hex)	Description
0	No subject detected
1	Subject detected
2	Error indicator
3	Not available or not installed

5.10.7 Control word

This object is based on object H6040 of the CiA® 402-2 V3.0 specifications.

Note

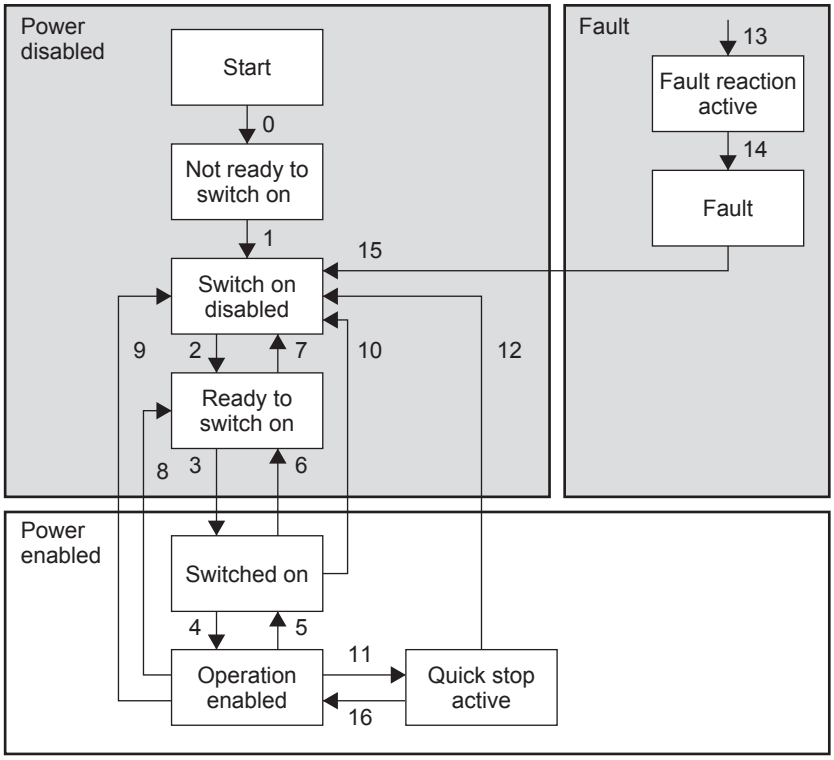
- Bits 9, 6, 5, and 4 of the control word are operation mode specific.
- The halt function (bit 8) behaviour is operation mode specific.
  If the bit is ON (1), the commanded motion shall be interrupted; the Power drive system shall behave as defined in the halt option code.
  After releasing the halt function, the commanded motion shall be continued if possible.

15	14	13 ... 11	10	9	8	7	6 ... 4	3	2	1	0
insp	rcl	ms	H0	oms	h	fr	oms	eo	qs	ev	so

Bit	Item	Description
Bit 0	so	Switch on
Bit 1	ev	Enable voltage
Bit 2	qs	Quick stop
Bit 3	eo	Enable operation
Bit 4 to 6	oms	Operation mode specific (Show in the Users Manual of the remote device)
Bit 7	fr	Fault reset
Bit 8	h	Halt
Bit 9	oms	Operation mode specific (Show in the Users Manual of the remote device)
Bit 10	-	Bit 10 fixed to OFF (0).
Bit 11 to 13	ms	Manufacturer-specific (Show in the Users Manual of the remote device)
1Bit 4	rcl	OFF (0): Emergency recall operation mode inactive ON (1): Emergency recall operation mode active
Bit 15	insp	OFF (0): Car top inspection operation mode inactive ON (1): Car top inspection mode active

Status transition

Number: Transition No.



Command	Bits of the control word					Transition No.
	Bit 7	Bit 3	Bit 2	Bit 1	Bit 0	
Shutdown	0	X	1	1	0	2, 6, 8
Switch on	0	0	1	1	1	3
Switch on + enable operation	0	1	1	1	1	3 + 4 (Note)
Disable voltage	0	X	X	0	X	7, 9, 10, 12
Quick stop	0	X	0	1	X	7, 10, 11
Disable operation	0	0	1	1	1	5
Enable operation	0	1	1	1	1	4, 16
Fault reset	0 → 1	X	X	X	X	15

Note

- At the following Transition numbers occur a automatic status transition: 0, 1, 13, 14
- Automatic transition to enable operation state after executing SWITCHED ON state functionality.

5.10.8 Status word

This object is equivalent to object H6041 in the CiA® 402-2 V3.0 specification.

15 ... 14	13 ... 12	11	10	9	8	7	6	5	4	3	2	1	0
ms	oms	ila	tr	rm	ms	w	sod	qs	ve	f	oe	so	rtso

Bit No.	Item	Description / set range
Bit 0	rtso	Ready to switch on
Bit 1	so	Switched on
Bit 2	oe	Operation enabled
Bit 3	f	Fault
Bit 4	ve	Voltage enabled ON when high voltage is applied to the Power drive system.
Bit 5	qs	Quick stop OFF When the Power drive system is reacting on a quick stop request.
Bit 6	sod	Switch on disabled
Bit 7	w	Warning ON when being a warning condition. The status of the Power drive system Finite state automaton does not be changed as warning is not an error or fault.
Bit 8	ms	Manufacturer-specific
Bit 9	rm	Remote When this bit is ON, the control word is processed. If it is off (local), the control word is not processed.
Bit 10	tr	Target reached • ON when the Power drive system has reached the set-point. The set-point is operation mode specific. This Bit is set to on, if the operation mode has been changed. • ON if the quick stop option code is 5, 6, 7 or 8, when the quick stop operation is finished and the Power drive system is halted. • ON when halt occurred and the Power drive system is halted.
Bit 11	ila	Internal limit active ON when an internal limit is active.
Bit 12 to 13	oms	Operation mode specific (Show in the Users Manual of the remote device)
Bit 14 to 15	ms	Manufacturer-specific (Show in the Users Manual of the remote device)

Status Word	Power Drive System Finite State Automaton State
xxxx xxxx x0xx 0000 b	Not ready to switch on
xxxx xxxx x1xx 0000 b	Switch on disabled
xxxx xxxx x01x 0001 b	Ready to switch on
xxxx xxxx x01x 0011 b	Switched on
xxxx xxxx x01x 0111 b	Operation enabled
xxxx xxxx x00x 0111 b	Quick stop active
xxxx xxxx x0xx 1111 b	Fault reaction active
xxxx xxxx x0xx 1000 b	Fault

5.10.9 Modes of operation

This object is equivalent to object H6060 in the CiA® 402-2 V3.0 specifications.

Value	Description
-128 to -1	Manufacturer-specific operation modes
0	No mode change or no mode assigned
+1	Profile position mode
+2	Velocity mode
+3	Profile velocity mode
+4	Torque profile mode
+5	Reserved
+6	Homing mode
+7	Interpolated position mode
+8	Cyclic sync position mode
+9	Cyclic sync velocity mode
+10	Cyclic sync torque mode
+11 to +127	Reserved

5.10.10 Modes of operation display

This object is equivalent to object H6061 in the CiA® 402-2 V3.0 specifications. This object provides the actual operation mode.
The value description can be shown in the Modes of operation object.

→ **Refer to Subsection 5.10.9**

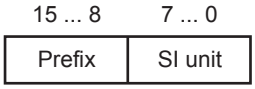
5.10.11 Target position

This object is equivalent to object H607A in the CiA® 402-2 V3.0 specifications. This object contains the commanded position that the drive should move to in position profile mode using the current settings of motion control parameters such as velocity, acceleration, deceleration, motion profile type etc. The value of this object shall be interpreted as absolute or relative depending on the 'abs/rel' flag in the control word. It shall be given in user-defined position units and shall be converted to position increments.

5.10.12 Load value

This object contains the load value (sub-index H01) and the related SI unit (sub-index H02). The load value is the absolute value of the load (payload). It is in units of the configured SI unit. The load value of HFFFF shall be an error value that is applied if the sensor is in error state or does not have an actual value.

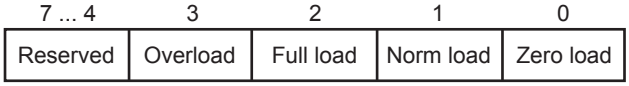
SI unit structure



The default SI unit is kg. The SI unit and prefix field values shall use the coding defined in the CiA® 303-2 specifications.

5.10.13 Load signalling

This object contains load signal information. It is used to signal measuring values of the load measuring system. Sub-index H01 contains different kinds of load signals. If one of the load bits (for zero load, norm load, full load, and overload) is set to ON (1), the related condition is true. If the bit is set to 0, the related condition is not true. Sub-index H02 contains the information regarding whether the related load bit shall be processed (1) or not (0).



6. Allocation of Buffer Memories

6.1 Buffer Memories (BFM) Lists

Caution

- Do not access buffer memory (BFM) that is marked as "Reserved" (Ex. BFM #23, #28, #31 to #34, #40 to #49, #60 to #99, #400, #443 to #600, etc.) by FROM/TO instructions, etc. There is a possibility to cause abnormal behavior to the operation of the FX3U-CAN if accessing these buffer memories.
- When BFM #21, #24, #26, #27, #59, #70, #71, #100 to #399, #1100 to #1267, #1900 to #1927 are written to, FX3U-CAN stores the state of the corresponding BFM in the built-in flash ROM. The maximum number of writes to the built-in flash ROM is 10,000 times.
  While BFM #25 bit7 is ON, any TO access is prohibited and will generate a BFM #29 bit5 failure!

Note

- When writing to a BFM that contains any bits marked as "Reserved" (Ex. BFM #20 bit 1 to bit 15, BFM #22 bit 2 to bit 15, etc), set such bits to OFF.
  There is a possibility to cause abnormal behavior to the operation of the FX3U-CAN if setting these flags to ON.
- Use BFM #22 to store the configuration.

BFM No.	Description	Default value	Read/ Write	Stored to Flash ROM	Reference
BFM #0 to #19	Receive/Transmit Process Data (CANopen® modes only)	H0	R/W	-	*1
BFM #20	Data Exchange Control	H0	R/W	-	Section 6.4
BFM #21	Function mode	K405	R/W	✓	Section 6.5

BFM #12540 to #12999	Reserved	-	-	-	-
BFM #13000 to #13539*3	Lift Application Transmit Data (TPDO) (CANopen® 417 Mode only)	-	R/W	-	Chapter 8
From #13540	Reserved	-	-	-	-

*1. Refer to the following items for each function mode.

→ **When using CANopen® 405 mode, refer to Chapter 7**

→ **When using CANopen® 417 mode, refer to Chapter 8**

→ **When using the 11 bit CAN-ID Layer 2 mode or 29 bit CAN-ID Layer 2 mode, refer to Chapter 9**

*2. Only in Layer 2 mode. The configuration area of the BFM is stored into the Flash ROM. For further information, refer to the following section.

→ **Refer to Section 9.1**

*3. Applicable for FX3U-CAN firmware Ver.1.10 or later.

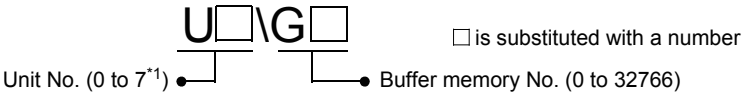
6.2 How to Read/Write from/to Buffer Memory

To read/write from/to buffer memory in the FX3U-CAN, use the FROM/TO instructions or the applied instructions that directly specify the buffer memory.
FX3U/FX3UC/FX5U/FX5UC PLC applicable software is required to perform direct specification of the buffer memory and bit specification of word devices.
For further information on applied instructions, bit specification of word devices, direct specification of buffer memory or special extension unit/block unit number, refer to following manual.

→ **Refer to Programming manual**

6.2.1 Direct specification of buffer memory (FX3U/FX3UC/FX5U/FX5UC only)

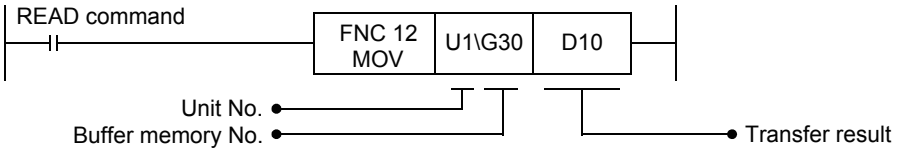
When directly specifying the buffer memory, specify the following device in the source or destination area of the applied instruction as follows:



*1. Unit No. 2 to No. 16 is assigned when the CPU module is an FX5U/FX5UC.

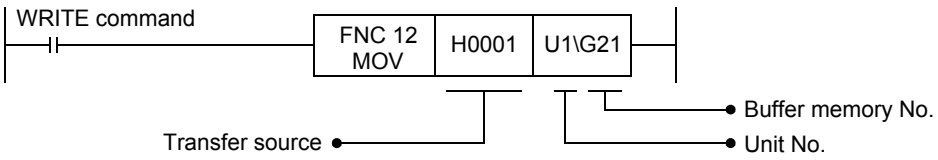
1. Reading out BFM data to PLC (MOV instruction)

If the following program is created, 1 point of data will be read out from buffer memory BFM #30 of unit No.1 to data register D10.



2. Writing PLC data into BFM (MOV instruction)

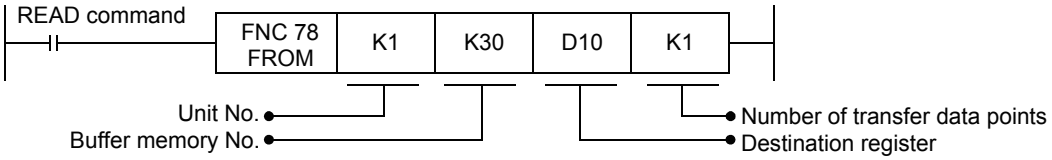
If the following program is created, 1 point of data (H0001) will be written to buffer memory BFM #21 of unit No.1.



6.2.2 FROM/TO instructions

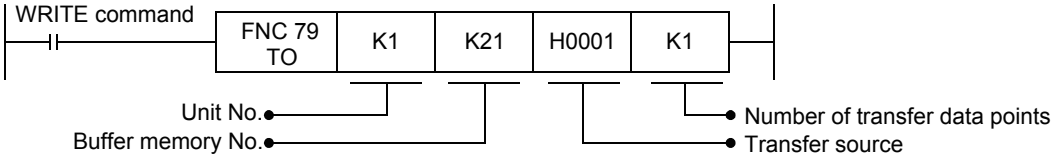
1. FROM instruction (Reading out BFM data to PLC)

Use the FROM instruction to read the data from the buffer memory.
If the following program is created, 1 point of data will be read out from buffer memory BFM #30 of unit No.1 to data register D10.



2. TO instruction (Writing PLC data into BFM)

Use the TO instruction to write data to buffer memory.
If the following program is created, 1 point of data (H0001) will be written to buffer memory BFM #21 of unit No.1.



6.3 Receive/Transmit Process Data

BFM #10000 to #10319 and #11000 to #11319 locations in the FX3U-CAN module are used for data communication to the CAN bus. The mapping for where each data is sent/received is explained in the following chapter.

→ **When using CANopen® 405 mode, refer to Chapter 7**
→ **When using CANopen® 417 mode, refer to Chapter 8**
→ **When using the 11 bit CAN-ID Layer 2 mode or 29 bit CAN-ID Layer 2 mode, refer to Chapter 9**

Note

In the CANopen® 417 Mode (BFM #21 = K417), only BFM #0 to #3, BFM #10000 to #10003 and BFM #11000 to #11003 (TPDO1/RPDO1) are usable. BFM #4 to #399, BFM #10004 to #10319 and BFM #11004 to #11319 are not accessible.

6.4 [BFM #20] Data Exchange Control

To ensure that the FX3U-CAN module can handle the CANopen® data in a consistent way, it is necessary to set in BFM #20 the corresponding Bit to ON before reading data (FROM) and after writing data (TO). The data exchange control signal ensures, by internal buffer exchange, that TO data from the PLC will be transmitted by PDO.
PDO transmit data will only be sent to the CAN bus if the module is in NMT state Operational and after setting the corresponding bits in BFM #20 to ON. As long as the reading of the previous data is not finished and a new exchange command to BFM #20 has not been sent, FROM data will not be overwritten by further PDO.
If the module is in NMT state Operational, PDO data received from other nodes can be read by the FX3G/FX3GC/FX3U/FX3UC/FX5U/FX5UC PLC by using a FROM instruction, and transmit PDO data can be written to the module and sent to the network by using a TO instruction.
The exchange data bit's will be reset automatically when the data exchange between BFM and Object Dictionary/Data exchange buffer is finished.

Note

- BFM #20 bit 0 will be reset automatically.
- During an active data exchange (BFM #20 bit 0 is ON), new write access to this BFM will be ignored.

Bit	Description	
	FROM (Read Access)	**TO (Write Access)**
Bit 0	Data exchange status OFF: Data exchange between BFM's and Data Exchange Buffer completed ON: Module exchanges data between BFM's and Data exchange buffer Note: This bit has the same function as Bit 8	Data exchange mode Control OFF: No data exchange between BFMs and CANopen® object dictionary / Layer 2 message buffer ON: Activate data exchange between BFMs and CANopen® object dictionary / Layer 2 message buffer Notes: • This bit merges the function of Bit 8, 9 and 12. • If the bit is set and the Module is not in CANopen® state Pre-Operational or Stopped, the PDO data will be exchanged after going into Operational state.
Bit 1 to 7	Reserved	
Bit 8	Only in CANopen® modes: Data exchange status (only OD data) OFF: Data exchange between BFM's and Data Exchange Buffer completed ON: Module exchanges data between BFM's and Data exchange buffer Note: This bit has the same function as Bit 0	Only in CANopen® modes: Data exchange mode setting (only OD data) OFF: No data exchange between BFM and CANopen® object dictionary ON: Activate data exchange between BFM and CANopen® object dictionary Notes: • The RPDO data of the Virtual Input mapping BFMs are not included in this data exchange. It can be handled separately by Bit 9. • The data will be also exchanged by setting Bit 0 • If the bit is set and the Module is not in CANopen® state Operational, the PDO data will be exchanged after going into Operational state.

Bit	Description	
	FROM (Read Access)	TO (Write Access)
Bit 9	Reserved	Only in 417 Function mode (Refer to BFM #21): Data exchange for the Virtual Input mapping BFMs. With this bit it's possible to read the Receive Buffer of the Virtual Input mapping without exchanging the data of all data exchange BFMs. OFF: No data exchange ON: Exchange data → **For FROM access of BFM #3001 to 3003, refer to Section 8.3** Note: The data will be also exchanged by setting Bit 0
Bit 10 to 11	Reserved	
Bit 12	Reserved	OFF: No data exchange between Emergency Message BFMs and EMCY Receive Buffer ON: Exchange data between Emergency Message BFMs and EMCY Receive Buffer → **For Emergency Message Buffer, refer to Section 6.23** Note: The data will be also exchanged by setting Bit 0
Bit 13 to 15	Reserved	

6.5 [BFM #21] Function Mode

Function mode of FX3U-CAN is set up. FX3U-CAN chooses the communication function corresponding to the function mode set in BFM #21.

Note

- The BFM setting needs to be stored by BFM #22 bit 0 and afterwards be restarted by BFM #25 bit 0 to make the new settings effective.

  → **Refer to Section 6.8**

- For the CANopen® profile (CiA® 405 or CiA® 417) mode, all saved OD settings will be deleted after mode change restart.

Set Value	Function Mode	Description
K11	11 bit CAN-ID Layer 2 mode	This mode supports the 11 bit CAN-ID Layer 2 Message.
K29	29 bit CAN-ID Layer 2 mode	This mode supports the 29 bit CAN-ID Layer 2 Message.
K405 (default)	CANopen® 405 mode	This mode supports the CANopen CiA® 405 IEC 61131-3 Programmable Device Profile.
K417	CANopen® 417 mode	This mode supports the CANopen CiA® 417 Lift Application Profile.
Other value	All other settings will generate a BFM #29 bit 6 failure.	

6.6 [BFM #22] Save/Restore Configuration

This BFM supports two bits that allow the default configuration of the BFMs to be restored and the configuration from BFMs to be stored into Flash ROM. Both bits will be reset automatically if the restore or save procedure is completed.

Note

- If both flags are set simultaneously, the corresponding BFMs and Flash ROM will be reset to factory default settings.
- If only bit 1 is set, corresponding BFM areas are restored to factory default values but not stored in Flash ROM.
  After changing the configuration, BFM #22 bit 0 has to be set ON to store these changed configuration BFMs to Flash ROM.

Object dictionary settings can be stored in Flash ROM and Object dictionary default settings can be restored using CIF commands.

→ **For CIF command, refer to Section 10.6 and Section 10.7**

Bit	Description	
	FROM (Read Access)	TO (Write Access)
Bit 0	ON when in store process.	Save configuration*1 to Flash ROM. When operation is completed, FX3U-CAN will automatically reset this bit.
Bit 1	ON when in restore process.	Restore factory default configuration (not saved to Flash ROM). When operation is completed, FX3U-CAN will automatically reset this bit.
Bit 2 to 15	Reserved	

*1. The stored/restored BFM configurations correspond to the function mode as shown in the table below;

Mode		Description	Reference
CANopen® 405 mode CANopen® 417 mode	11 bit CAN-ID Layer 2 mode 29 bit CAN-ID Layer 2 mode		
Saved	Saved	Function mode in BFM #21.	Section 6.5
Saved	Saved	Baud Rate in BFM #24.	Section 6.7
Saved	Saved	FROM/TO Watchdog in BFM #26.	Section 6.9
Saved	Not saved	Node Address in BFM #27.	Section 6.10
Saved	Not saved	Daily correction in BFM #59.	Section 6.19
Not saved	Saved	The CAN ID and data length for transmitting message in BFM #100 to #399.	Section 9.1
Not saved	Saved	Pre-defined Layer 2 message configuration in BFM #1100 to #1267.	Section 9.3
Not saved	Saved	PLC RUN>STOP message in BFM #1900 to #1927.	Section 9.6
Saved	Not saved	NMT start all Nodes delay in BFM #70	Section 6.20
Saved	Not saved	SDO Time Out in BFM #71	Section 6.21

6.7 [BFM #24] Baud Rate

Set the baud rate in this BFM. The current baud rate can be found in BFM #37.

Note

- The Baud Rate must be equal for all nodes in the network.
- The new value needs to be stored by BFM #22 and the Module has to be restarted to make the new setting effective.

BFM Value	Description
K10	Baud Rate 10kbps
K20	Baud Rate 20kbps
K50	Baud Rate 50kbps
K100	Baud Rate 100kbps
K125	Baud Rate 125kbps
K250	Baud Rate 250kbps
K500	Baud Rate 500kbps
K800	Baud Rate 800kbps
K1000	Baud Rate 1000kbps
Other value	Setting prohibited If an invalid baud rate is written to BFM #24, the BFM will keep its former value and BFM #29 bit 11 will be set.

6.8 [BFM #25] Communication Status

Displays the FX3U-CAN communication status.

Note

- A change of the function mode, the baud rate, or Node ID requires a restart of the FX3U-CAN to become effective.
- If a configuration BFM is written to while in online mode (BFM #25 bit 4 is ON), BFM #29 bit 5 will be set ON.
- When BFM #25 bit 7 is ON, the Module is initializing the internal data structures and the BFM, and any TO command (write access) prohibited. If the BFM is written to, BFM #29 bit 5 will be set to ON.
  When BFM #25 bit 7 is bit ON, the only access allowed is to read (FROM) BFM #25 and BFM #29.

Module restart

When restarting the module, set BFM #25 Bit 0 to ON.
In this case, set data that was not saved will be lost.

Bit	Description	
	FROM (Read Access)	TO (Write Access)
Bit 0	Module online/offline **Layer 2 modes:** OFF: Offline ON: Online **CANopen® modes:** OFF: Not in Operational State ON: Operational State	Module restart A restart is necessary to activate a new setting of the function mode (BFM #21), the baud rate (BFM #24), the Node-Id (BFM #27) or to activate the NMT master setting. → **Refer to Subsection 5.8.5 and Section 6.5, 6.7 and 6.10** All not saved settings will be lost. OFF: Normal operation ON: Restart module
Bit 1	OFF: The error counter is below the warning level, in error passive or in bus-off. ON: The error counter of the CAN controller has reached the warning level. → **Refer to and Section 6.13 and 6.14**	Reserved
Bit 2, 3	Reserved	

<table>
<tr><th rowspan="2">Bit</th><th colspan="2">Description</th></tr>
<tr><th>FROM (Read Access)</th><th>TO (Write Access)</th></tr>
<tr><td>Bit 4</td><td colspan="2">CANopen® mode:
Reserved

<tr><td>Bit 15</td><td>OFF: Module works as NMT Slave
ON: Module works as NMT Master</td><td>Reserved</td></tr>
</table>

6.9 [BFM #26] FROM/TO Watchdog

The FROM/TO Watchdog can be used when the Module is online to monitor if the PLC program accesses data BFM #0 to BFM #19, BFM #100 to #399 or BFM #3000 to BFM #3539 cyclically.
After the first FROM/TO on the data BFM, the Watchdog will check if the next access to the data BFM takes place before the time set in BFM #26 expires.
BFM #26 sets the Watchdog timer in 10 ms steps (default value K20 equals 200 ms).

Note

- If the watchdog expires, bit 7 in BFM #29 is set to ON, and the messages defined in the BFM #1900 to #1927 "PLC RUN>STOP messages" area or an EMCY Object are transmitted on the network. If the module is in a CANopen® Mode, the module will react according to the value set in the Error behavior object (Index H1029) in the object dictionary.

  → **For PLC RUN>STOP messages, refer to Section 9.6**
  → **For EMCY Object, refer to Subsection 5.6.13**
  → **For Error behaviour object, refer to Section 5.7**

- If the watchdog function is not required, it can be deactivated by writing K0 to BFM #26.
- The FROM/TO watchdog can be restarted by writing the setting value to BFM #26 again, which will also reset the error flag in BFM #29.

6.10 [BFM #27] Node Address

This BFM sets CANopen® Node-ID. The setting value range is 1 to 127.

Note

- The BFM setting needs to be stored by BFM #22 bit 0 and afterwards be restarted by BFM #25 bit 0 to make the new setting effective.
- A setting out of the above range or a write access in Layer-2 function mode will generate a Failure Message in BFM #29 bit 6.

6.11 [BFM #29] Error Status

For further information on error status, refer to the following section.

→ **Refer to Section 14.2**

6.12 [BFM #30] Module ID Code

The identification code for FX3U-CAN is available using a FROM instruction. The identification code for the FX3U-CAN is K7170. By reading this identification code, the user may create built-in checking routines in the PLC program to check whether the physical position of the FX3U-CAN on the special function unit bus matches the program.

6.13 [BFM #35] CAN Transmission Error Counter

FX3U-CAN stores the current value of the CAN transmit error counter. The CAN transmit message error counter counts up to K256.
The counter counts 1 or 8 up if a transmission error is detected. For each transmission without error, the counter counts 1 down.

Value	Description
K0 to K127	Error active status Warning level if value is K96 to K127.
K128 to K255	Error passive status
K256	BUS-OFF status

Note

The Warning Level is also shown in BFM #25 bit 1, Error Passive and Bus OFF are shown in BFM #29.

6.14 [BFM #36] CAN Reception Error Counter

FX3U-CAN stores the current value of the CAN reception error counter. The CAN reception error counter counts up to K128.
The counter counts 1 or 8 up if a reception error is detected. For each reception without error, the counter counts 1 down.
However, when FX3U-CAN is in BUS-OFF status, K256 is stored in this BFM.

Value	Description
K0 to K127	Error active status Warning level if value is K96 to K127.
K128	Error passive status
K256	BUS-OFF status

Note

The Warning Level is also shown in BFM #25 bit 1, Error Passive and Bus OFF are shown in BFM #29.

6.15 [BFM #37] Baud Rate Display

Displays the current baud rate of the CAN Controller in units of 0.1 kbps.

6.16 [BFM #38] Sampling Point Display

Displays the current sampling point of the CAN Controller in units of 0.1%.

6.17 [BFM #39] BFM Setting Error Display

BFM #29 bit 6 is set to ON if an attempt to write an invalid value into a Buffer Memory is detected.
BFM #39 displays the address of the target BFM of the invalid write attempt. In case an irregular value was written to more than one BFM, only the address of the first BFM is displayed. BFM #39 is reset by writing K0 to BFM #29.

6.18 [BFM #40] BFM Initialisation/Online Mode Write Error Display

BFM #29 bit 5 is set to ON if an attempt to write into a Buffer Memory while module is in initialisation mode or in Layer 2 online mode is detected.
BFM #40 displays the target BFM address of the invalid write attempt. In case an irregular write access is made to more than one BFM, only the address of the first BFM is displayed. When BFM #29 bit 5 is set to OFF, BFM #40 will be reset to K0.

6.19 [BFM #50 to #59] Time Stamp

CANopen® devices which operate a local clock may use the TIME object to adjust their own time base to the time of the time stamp producer.
After power up or reset of the FX3U-CAN, the clock data is set to default values, and the clock is stopped. FX3U-CAN sets up producer or consumer of Time stamp by BFM #50. When FX3U-CAN is the current Network Master or Producer, set the clock data to BFM #51 to #59. The current Time stamp of CANopen® network can read the clock data from BFM #51 to #57.

- When the FX3U-CAN is set up as Consumer, the clock starts counting after receiving the first Time stamp object.
- When the FX3U-CAN is set up as Producer, the clock starts after setup of BFM #50 to #58.
- The FX3U-CAN will only produce the Time stamp if it is the current Network Master and in CANopen® state Operational or Pre-operational.

Note

- After power up or reset of the FX3U-CAN, the clock data is set to default values, and the clock is stopped.
- The data and time will be checked when BFM #56 is written. If value is outside of the allowed range BFM #29 bit 6 will be set to ON.

→ **For BFM #29 bit 6, refer to Section 14.2**

- When the FX3U-CAN is set up as consumer, write access to BFM #51 to #59 will be ignored.
- When FX3U-CAN is the current Network Master and Producer, the first time stamp will be sent after setting BFM #58.
- There is always a delay in time due to latency during writing to the BFM and during the transmission over the CAN bus.
- A leap year correction is provided.
- Clock tolerance: ±132 sec/month (at 25°C)
- The resolution of the Time stamp object in the FX3U-CAN is in units of second. All values outside of the Setting range will be ignored, and the old value will persist. If a Time stamp object is received, BFM #25 bit 12 will be set.

→ **For communication status (BFM #25), refer to Section 6.8**

Note: When handling built in clock data of PLC

The FX3U-CAN can handle built-in clock data of the PLC using TRD (FNC166) and TWR (FNC167) instructions. However, be careful of different year data specifications.
For further information on the TRD (FNC166) and TWR (FNC167) instructions and built-in clock data specifications of the PLC, refer to the following manual.

→ **Refer to Programming manual**

- CAN network
  K0 to K99 in Time stamp year corresponds to year 2000 to 2099.
  The higher two digits is ignored. If writing K1984, the module will send a Time stamp with the year 2084.
- FX Series PLC built-in RTC
  K80 to K99 correspond to "1980 to 1999", and "00 to 79" correspond to "2000 to 2079".
  Examples:
  "80" indicates 1980. "99" indicates 1999. "00" indicates 2000. "79" indicates 2079.

BFM No.	Name	Description
BFM #50	Time stamp producer/consumer	Sets the Time stamp producer/consumer. The BFM directly accesses the Consumer/Producer bits of the Time COB-ID in the Object Dictionary. → **For Time object, refer to Subsection 5.6.10** **Setting range:** K0: Time stamp disabled K1: Consumer K2: Producer*1 K3: Producer*1/Consumer

*1. Time stamp will be only produced if the module is active NMT Master.

BFM No.	Name	Description
BFM #51	Time stamp year	K0 to K99 (lower two digits) K0 to K99 in Time stamp year corresponds to 2000 to 2099 year. The higher two digits is ignored. If writing K1984, the module will send a Time stamp with the year 2084.
BFM #52	Time stamp month	K1 (January) to K12 (December)
BFM #53	Time stamp day	K1 (1st) to K31 (31st)
BFM #54	Time stamp hour	K0 (0 o'clock) to K23 (23 o'clock)
BFM #55	Time stamp minute	K0 (00 minutes) to K59 (59 minutes)
BFM #56	Time stamp second	K0 (00 seconds) to K59 (59 seconds)
BFM #57	Time stamp Day-of-the-week	K0 (Sunday) to K6 (Saturday) This BFM is read only. The Day of the week will be calculated during setup of the RTC automatically.
BFM #58	Time stamp transmission interval	Set the transmission time interval for the Time stamp Object in multiples of minutes. The first time stamp will be sent after setting this BFM. If the FX3U-CAN is configured as Consumer, this setting will be ignored. **Setting range;** K0: Time stamp transmission disabled K1 to K1440: 1 minute to 1440 minutes (24 hours)
BFM #59	Daily correction	A constant miscount of the Clock can be corrected in steps of 1 sec / day. **Setting range:** -60 to +60

Time stamp setting procedure

To keep the consistency of Time stamp data, clock data should be set by the following procedure.

1) Set Time stamp producer/consumer in BFM #50.
2) Set clock data of Year, Month, Day, Hour and Minute in BFM #51 to #55. (Producer only)
3) Set clock data of Second in BFM #56.
   All clock data will be written to the RTC and checked for validity when BFM #56 is written to. If the data is not valid, the RTC will not be set.
4) Set Time stamp transmission interval in BFM #58.
   The first time stamp will be sent after BFM #58 is written to.

Time stamp read procedure

To keep the consistency of Time stamp data, clock data should be read by the following procedure.

1) Read clock data of Year from BFM #51.
   All clock data will be read from the RTC and written to BFMs #51 to #57 when BFM #51 is read.
2) Read clock data of Month, Day, Hour, Minute, Second and Day-of-the-week from BFM #52 to #57.

6.20 [BFM #70] NMT Start all Nodes delay

During the NMT master startup, the NMT master sends a NMT Reset communication all Nodes and NMT Start all Nodes depending on the configuration.
This BFM value sets the minimum time between these two NMT messages, to ensure that a slow NMT Slave recognizes the NMT Start all Nodes message.
The value can be set in ms (default: 500ms).
The setting range is 0ms to 65535ms.

→ **For NMT Startup process, refer to Subsection 5.8.4**

6.21 [BFM #71] SDO Time out

The Time out for SDO communication set with this BFM.
The value can be set in ms (default: 500ms).
The setting range is 50ms to 32767ms.

→ **For SDO, refer to Subsection 5.6.4**

6.22 [BFM #601 to #727] NMT State

This BFM displays the NMT status of the CANopen® nodes (index H1F82, Sub index 01 to 127 of the CANopen® Object Dictionary). Use the SDO Command in the CIF to set the NMT state of the whole network or of one specific node. For NMT Slaves, the NMT Status is only displayed for Nodes for which Heartbeat Consuming is configured.
If the NMT Master is using Heartbeat Consuming or Node Guarding, the current NMT State of an NMT Slave will display its actual NMT State as long as error control messages are received. For Nodes for which no error control service is configured, the NMT Master will display the NMT state from the last request.

→ **For Object H1F82, refer to Subsection 5.8.9**
→ **For Heartbeat, refer to Subsection 5.6.9**
→ **For SDO Command, refer to Section 10.2**

Note

- If a NMT state request is made to all nodes, all BFM displays will change.
  To activate the display of a missing mandatory device, configure the Boot time out (refer to Object Dictionary Index H1F89) and set this Node-Id as a mandatory CANopen® device (refer to Object Dictionary Index H1F81).

→ **For Object Dictionary Index H1F89, refer to Section 5.6**
→ **For Object Dictionary Index H1F81, refer to Subsection 5.8.7**

- If no error control service is configured or if error control messages are missing, it is possible that an NMT state other than the actual remote NMT state will displayed. Use these BFMs and BFM #900 to #963 NMT Error Control Status and BFM #29 to detect error control service failures.

→ **For BFM #900 to #963, refer to Section 6.24**
→ **For BFM #29, refer to Section 14.2**

BFM No.	Description
BFM #601	Node 1
BFM #602	Node 2
BFM #603	Node 3
⋮	⋮
BFM #726	Node 126
BFM #727	Node 127

6.23 [BFM #750 to #859] Emergency Message Buffer

The FX3U-CAN will store the Emergency messages which are received from the bus to an internal buffer. This buffer can store up to 22 emergency messages and is separated into an 11 message stack buffer (BFM #750 to #804) and an 11 message ring buffer (BFM #805 to #859). The stack buffer will store the first 11 emergency messages received after Power On or after the Emergency message buffer was cleared the last time. The ring buffer will store the next eleven Emergency messages; all further received Emergency telegrams will overwrite the oldest message in the ring buffer. The stack buffer will not be overwritten.

Note

To ensure that the EMCY data is handled in a consistent way, it is necessary to set in BFM #20 bit 0 or 12 to ON before reading the EMCY data (FROM).
When clearing the entire buffer, write H0 to BFM #750.

BFM No.	Name		Description	
			High Byte	Low Byte
BFM #750	Node ID	stack buffer	The Node-ID number which sent the emergency message to the network is displayed.	
BFM #751	EMERGENCY data		Emergency error code*1 (oldest message)	
BFM #752	EMERGENCY data		1st byte of Manufacturer-specific error code*2	Error register → **For Error register (object H1001), refer to Subsection 5.6.2**
BFM #753	EMERGENCY data		3rd byte of Manufacturer-specific error code*2	2nd byte of Manufacturer-specific error code*2
BFM #754	EMERGENCY data		5th byte of Manufacturer-specific error code*2	4th byte of Manufacturer-specific error code*2
⋮	⋮		⋮	
BFM #800	Node ID		The Node-ID number which sent the emergency message to the network is displayed.	
BFM #801	EMERGENCY data		Emergency error code*1	
BFM #802	EMERGENCY data		1st byte of Manufacturer-specific error code*2	Error register → **For Error register (object H1001), refer to Subsection 5.6.2**
BFM #803	EMERGENCY data		3rd byte of Manufacturer-specific error code*2	2nd byte of Manufacturer-specific error code*2
BFM #804	EMERGENCY data		5th byte of Manufacturer-specific error code*2 (newest message)	4th byte of Manufacturer-specific error code*2 (newest message)
BFM #805	Node ID	ring buffer	The Node-ID number which sent the emergency message to the network is displayed. (oldest message)	
BFM #806	EMERGENCY data		Emergency error code*1	
BFM #807	EMERGENCY data		1st byte of Manufacturer-specific error code*2	Error register → **For Error register (object H1001), refer to Subsection 5.6.2**
BFM #808	EMERGENCY data		3rd byte of Manufacturer-specific error code*2	2nd byte of Manufacturer-specific error code*2
BFM #809	EMERGENCY data		5th byte of Manufacturer-specific error code*2	4th byte of Manufacturer-specific error code*2
⋮	⋮		⋮	
BFM #855	Node ID		The Node-ID number which sent the emergency message to the network is displayed.	
BFM #856	EMERGENCY data		Emergency error code*1	
BFM #857	EMERGENCY data		1st byte of Manufacturer-specific error code*2	Error register → **For Error register (object H1001), refer to Subsection 5.6.2**
BFM #858	EMERGENCY data		3rd byte of Manufacturer-specific error code*2	2nd byte of Manufacturer-specific error code*2
BFM #859	EMERGENCY data		5th byte of Manufacturer-specific error code*2 (newest message)	4th byte of Manufacturer-specific error code*2 (newest message)

*1. Emergency error codes

In different CiA® Device/Application Profiles, more EMCY Error Codes are defined.

→ **For EMCY Error Codes that are not in the following table, refer to the manual of the device which sent the message**

Error Code (hex)	Description
0000	Error reset or no error
0010	CiA® 417: CAN warning level
1000	Generic error
2000	Current – generic error
2100	Current, CANopen® device input side – generic
2200	Current inside the CANopen® device – generic
2300	Current, CANopen® device output side – generic
3000	Voltage – generic error
3100	Mains voltage – generic
3111	CiA® 417: Mains Over voltage
3121	CiA® 417: Mains Under voltage
3200	Voltage inside the CANopen® device – generic
3211	CiA® 417: Over voltage (device internal)
3221	CiA® 417: Under voltage (device internal)
3300	Output voltage – generic
4000	Temperature – generic error
4100	Ambient temperature – generic
4200	Device temperature – generic
5000	CANopen® device hardware – generic error
6000	CANopen® device software – generic error
6100	Internal software – generic
6200	User software – generic
6300	Data set – generic

Error Code (hex)	Description
7000	Additional modules – generic error
8000	Monitoring – generic error
8100	Communication – generic
8110	CAN overrun (objects lost)
8120	CAN in error passive mode
8130	Life guard error or heartbeat error
8140	Recovered from bus off
8150	CAN-ID collision
8F01 to 8F7F	Life guard error or heartbeat error caused by Node-ID 1 to Node-ID 127.
8200	Protocol error – generic
8210	PDO not processed due to length error
8220	PDO length exceeded
8230	DAM MPDO not processed, destination object not available
8240	Unexpected SYNC data length
8250	RPDO timeout
9000	External error – generic error
F000	Additional functions – generic error
FF00	Device specific – generic error*2
FF01	CiA® 417: Light barrier defect*2
FF02	CiA® 417: Finger protector defect*2
FF03	CiA® 417: Motion detection defect*2
FF04	CiA® 417: Application error, Manufacturer-specific error code: Byte 0 and 1 contain a Text error code, Byte 2 to 4 are reserved*2

*2. EMCY Manufacturer specific error codes

EMCY Manufacturer specific error codes of the FX3U-CAN are shown below. EMCY Manufacturer Specific error codes are expressed by five ASCII code characters. However, the lower 2 bytes of the Manufacturer Specific Error code corresponding to Emergency Error Code "8250" uses four hexadecimal digits instead of ASCII code.

Emergency Error Code (hex)	Manufacturer Specific Error code (hex)					Description
	5th Byte	4th Byte	3rd Byte	2nd Byte	1st Byte	
FF00	46	58	30	30	31	"FX001": Main unit/CPU error occurs
FF00	46	58	30	30	32	"FX002": Main unit state changed from RUN to STOP Also occurs when the main unit is powered ON in the STOP state.
6200	46	58	30	30	33	"FX003": FROM/TO Watchdog expired
6200	46	58	30	30	34	"FX004": Module reset by BFM #25 bit 0 → **For module reset, refer to Section 6.8**
8250	50	44	4F	XX	XX	"PDO"X: RPDO Nr HXXXX Event Timer expired

6.24 [BFM #900 to #963] NMT Error Control Status

This BFM displays the Node Guarding and Heartbeat status.

Note

- When resetting the local NMT error latch, write H0 to the corresponding bit of this BFM.
- If bit 2 to 7 of any node is ON, BFM #29 bit 10 will be set.
- If the bit 10 in BFM #29 is reset to OFF, all failure bits in BFM #900 to #963 will be reset to OFF.

BFM No.	Description	
	High Byte	Low Byte
BFM #900	Node 2 status	Node 1 status
BFM #901	Node 4 status	Node 3 status
BFM #902	Node 6 status	Node 5 status
BFM #903	Node 8 status	Node 7 status
⋮	⋮	⋮
BFM #962	Node 126 status	Node 125 status
BFM #963	Unused (H0)	Node 127 status

Status Flags

Bit No.	Description	
Bit 0	Node guarding	Node Guarding is active
Bit 1	Heartbeat	Heartbeat is active. This bit is set after reception of the first Heartbeat message.
Bit 2	Node guarding	One node guarding message is missed or Toggle Bit error.
Bit 3	Node guarding	No response and Lifetime elapsed
Bit 4	NMT startup failed.	
Bit 5	Node guarding	The node does not have the expected state.
Bit 6	Node guarding	Guarding failed. Node Guarding remote requests of the NMT Master was not received in the expected time.
Bit 7	Heartbeat	Heartbeat is missing

7. CANopen® 405 Mode

7.1 Data Transfer Location for CANopen® 405 Mode

This section explains data transfer locations for CANopen® 405 mode. BFM #10000 to #10319 and #11000 to #11319 are used as data transfer locations.

Note

- The data will be exchanged only when the module is in OPERATIONAL State.
- To ensure that the FX3U-CAN module can handle the CANopen® data in a consistent way, it is necessary to use the data exchange by BFM #20 bit 0 or 8 to ON before reading PDO data (FROM) and after writing PDO data (TO) to the module.
  The data exchange control signal ensures, by internal buffer exchange, that TO data from the PLC will be transmitted with its corresponding PDO at the same time.

7.1.1 Direct TO BFM Access to the CANopen® 405 Object

Use the TO instruction to write data to the following locations. The default TPDO mapping is assigned to unsigned 16 bit objects (Index HA100).

To change this setting, use the SDO command in the CIF or a CANopen® configuration software.

→ **For SDO command in the CIF, refer to Section 10.2**

→ **For the CANopen® configuration software, refer to the manual of the software to be used**

Note

The data which are written to the BFM will only be copied into the Object Dictionary when they are mapped into a PDO. Example: BFM #11000 is assigned to the Object Dictionary Indexes/Sub-indexes HA240/H01, HA200/H01, HA1C0/H01, HA100/H01, HA0C0/H01, HA040/H01, H02 and HA000/H01, H02. If none of these Indexes are mapped into a TPDO, the data will not be copied from the BFM into any of the assigned Object Dictionary Indexes/Sub-indexes.

Index HA240 float 32 bit object	Index HA200 unsigned 32 bit object	Index HA1C0 signed 32 bit object	Index HA100 unsigned 16 bit object	Index HA0C0 signed 16 bit object	Index HA040 unsigned 8 bit object	Index HA000 signed 8 bit object	Assigned BFM

			50	50	9F	9F	BFM #399 and #11319, lower 8 bit
					A0	A0	BFM #399 and #11319, higher 8 bit

7.1.2 Direct FROM BFM access to the CANopen® 405 Object

Use the FROM instruction to read data from the following locations. The default RPDO mapping is assigned to unsigned 16 bit objects (Index HA580).

To change this setting, use the SDO command in the CIF or a CANopen® configuration software.

→ **For SDO command in the CIF, refer to Section 10.2**

→ **For the CANopen® configuration software, refer to the manual of the software to be used**

Note

If data is written with an SDO into the Object Dictionary to one of the BFM corresponding Indexes/Sub-indexes, only the last data written is visible in the BFM. The data of the corresponding Indexes/Sub-indexes are not synchronized to each other.

Index HA6C0 float 32 bit object	Index HA680 unsigned 32 bit object	Index HA640 signed 32 bit object	Index HA580 unsigned 16 bit object	Index HA540 signed 16 bit object	Index HA4C0 unsigned 8 bit object	Index HA480 signed 8 bit object	Assigned BFM

					A0	A0	BFM #399 and #10319, higher 8 bit

7.2 PDO Mapping/Binding of the Network for CANopen® 405 Mode

In order to exchange data by CANopen®, the data channels between the nodes must be defined or "mapped".
For large networks, the usage of a proper CANopen® network configuration tool*1 which is able to support easy parameter settings and PDO mapping is recommended.
To build up a small network or for testing purposes, the FX3U-CAN supports three PDO mapping/binding modes which can be executed by the Command Interface. By using these predefined Mapping configurations, the CAN object ID (COB-ID) number for data exchange of each node is clearly defined.

→ **For function mode setting for CANopen® 405 mode, refer to Section 6.5**

*1. Example: Vector ProCANopen

Note

It is strongly recommended to execute the Mapping Commands only in the Pre-operational mode of all related CANopen® nodes.
For a complete list of the assignment between the data BFM and the CANopen® data objects and their location in the Object Dictionary, refer to the following section.

→ **Refer to Subsection 7.2.1 and Subsection 7.2.2**

Note that the NMT Master startup process uses SDO's which can be result in an Error of the CIF SDO command if the NMT Startup Master acceses the remote Node at the same time.

7.2.1 TPDO mapping table

The assignment in this table is only for the default TPDO mapping setting (unsigned 16 bit objects). To change the BFM assignment of the TPDO, the mapping parameter has to be changed in the Object Dictionary.

→ **For the default TPDO mapping setting, refer to Subsection 7.1.1**
→ **For the TPDO communication and mapping parameter in the Object Dictionary, refer to Subsection 5.6.5**
→ **For the SDO command in the CIF, refer to Section 10.2**
→ **For the CANopen® configuration software, refer to the manual of the software to be used**

TPDO	Mode 0 Mapping (default)	Mode A Mapping	Mode B Mapping	Assigned BFM
	COB ID			
TPDO 1	H0180 + node ID		H0180 + node ID	#0 to #3 #11000 to #11003

7.2.2 RPDO mapping table

The assignment in this table is only for the default RPDO mapping setting (unsigned 16 bit objects). To change the BFM assignment of the RPDO, the mapping parameter has to be changed in the Object Dictionary.

→ For the default RPDO mapping setting, refer to Subsection 7.1.2
→ For the RPDO communication and mapping parameter in the Object Dictionary, refer to Subsection 5.6.5
→ For the SDO command in the CIF, refer to Section 10.2
→ For the CANopen® configuration software, refer to the manual of the software to be used

RPDO	Mode 0 Mapping (default)	Mode A Mapping		Mode B Mapping	Assigned BFM

7.2.3 Mode 0 mapping

By executing the Mode 0 mapping command shown below, the number of automatically assigned TPDOs and RPDOs becomes four. All RPDO/TPDO communication and mapping parameter and the BFM/Object dictionary assignment will be reset to factory default. The BFM content of the Receive/Transmit Process Data BFM's will be set to zero.

BFM #0 to #15 are distributed to RPDOs and TPDOs 1 to 4 as shown in the TPDO/RPDO mapping table.
This setting is useful for a network that features many different types of nodes or as a base for a network mapping configured with the Mode B mapping command.
The PDOs 5 to 80 (BFM #16 to #19 and #100 to #399) are disabled in the default settings but further mapping of these PDOs can be accomplished by using the Mode B mapping technique or SDO.

→ **For RPDO/TPDO communication and mapping table, refer to Subsection 5.6.5**
→ **For BFM assignment of the Receive/Transmit Process Data BFM's, refer to Subsection 7.1.1 and Subsection 7.1.2**
→ **For Mode B COB-ID mapping command, refer to Subsection 7.2.5**

Execution procedure: Mode 0 mapping

1) To execute the Mode 0 command, write H8900 to BFM #1000.
2) After the Mapping is successfully established, H8901 is written to BFM #1000.

→ **In case of trouble, refer to Section 10.9**

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H8901: Mapping successful established HFFFF: CIF Busy H000F: Error	Command: H8900
BFM #1001 to #1066	Unused	Unused

7.2.4 Mode A mapping

Easy setup of a CANopen® network of up to eight FX3U-CAN nodes can be accomplished by simply using the Mode A Mapping configuration. All FX3U-CAN modules have to be set up via the local PLC. One of the nodes must be configured as the network master. The network master can be defined in the Network Configuration tool or by writing to the Object Dictionary using the CIF SDO write command.
All RPDO/TPDO communication and mapping parameter and the BFM/Object dictionary assignment will be reset to Mode A default. The BFM content of the Receive/Transmit Process Data BFM's will be set to zero. The COB-IDs will be changed to the values shown in the tables in the Subsection 7.2.1 and Subsection 7.2.2. After all stations have executed the Mode A Mapping command, 16 data words can be exchanged with other FX3U-CAN modules.
A closer look at the mapping shows that the TPDO is dependent upon the node ID but the mapping for the RPDO is fixed to the default TPDO COB-ID of stations 1 to 8. The advantage is that the data location of all FX3U-CAN modules is the same.

To include non FX3U-CAN CANopen® nodes to the network, it is necessary to change the RPDO and communication parameters of these stations. This can be done by the Mode B mapping command, the SDO write access command, or by a standard configuration tool.

→ **For RPDO/TPDO communication and mapping table, refer to Subsection 5.6.5**
→ **For SDO command in the CIF, refer to Section 10.2**
→ **For the CANopen® configuration software, refer to the manual of the software to be used**
→ **For BFM assignment of the Receive/Transmit Process Data BFM's, refer to Subsection 7.1.1 and Subsection 7.1.2**
→ **For Mode B COB-ID mapping command, refer to Subsection 7.2.5**

Execution procedure: Mode A mapping

1) To execute the Mode A command, write H8200 to BFM #1000.
2) After the Mapping is successfully established, H8201 is written to BFM #1000.

→ **In case of trouble, refer to Section 10.9**

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H8201: Mapping successfully established H82FF: Local node number not in range 1 to 8 Local node number must be in the range 1 to 8 HFFFF: CIF Busy H000F: Error	Command: H8200
BFM #1001 to #1066	Unused	Unused

7.2.5 Mode B COB-ID mapping

With Mode B COB-ID Mapping, it is possible to build up bindings between any nodes connected to the FX3U-CAN module and the FX3U-CAN module itself or any other nodes also connected to the FX3U-CAN. Mode B COB-ID mapping is limited to the binding of the PDO COB-ID already configured in the remote stations (No change of the PDO mapping parameter).
All three Mode B COB-ID mapping options can be mixed within one CIF Function call.

Mode B COB-ID Mapping options	Reference
Reset Mapping Table to default Mode B COB-ID mapping	page 136
Assign Source TPDO COB-ID to Destination RPDO COB-ID	page 137
Assign Additional TPDO COB-IDs to the Local Node	page 138

The Mode B COB-ID mapping command will modify the current PDO COB-ID at the Destination, therefore it is important to have a clearly defined mapping base before executing any Mode B commands. Executing the Mode B COB-ID Mapping commands before adjusting the PDO mapping parameters (adjusting the PDO data length) may create errors in the data transmission or module operation.
The PDO mapping base can be the "Mode 0" mapping or the "Mode A" mapping explained in previous sections to prepare default RPDO and TPDO formats. Another method to create (or reset) a Mapping base is to initialize the Mode B Mapping with a special instruction at the beginning of the Mode B Mapping Command. If it is necessary to change the remote node hardware mapping, this can be done by the SDO write access command or by a standard CANopen® network configuration tool.
The configuration with the Mode B mapping is controlled by parameters, which are displayed in the table on the following page.

→ **For the SDO write access command in the CIF, refer to Subsection 10.2.3**
→ **For BFM assignment of the Receive/Transmit Process Data BFM's, refer to Subsection 7.1.1 and Subsection 7.1.2**
→ **For the CANopen® configuration software, refer to the manual of the software to be used**
→ **For the default RPDO and TPDO formats, refer to Subsection 7.2.1 and Subsection 7.2.2**

Reset Mapping Table to default Mode B COB-ID mapping

This command sets Mode B default settings on the local Node. All RPDO/TPDO communication and mapping parameter and the BFM/Object dictionary assignment will be reset to factory default. The BFM content of the Receive / Transmit Process Data BFM's will be set to zero. The COB-IDs will be changed to the values shown in the tables in the Subsection 7.2.1 and Subsection 7.2.2.

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H8301: Mapping successfully established HFFFF: CIF Busy H000F: Error	Command: H8300
BFM #1001	H0	H0
BFM #1002	H0	H0
BFM #1003 ⋮ BFM #1066	Other Mode B COB-ID mapping command response.	Other Mode B COB-ID mapping options or terminate with HFFFF in BFM #1003.

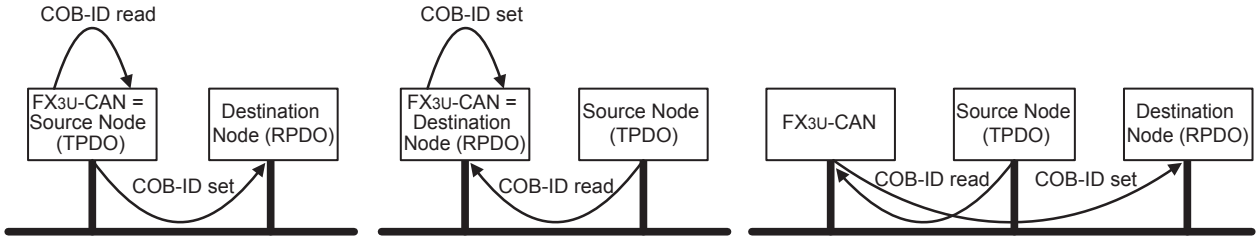
Assign Source TPDO COB-ID to Destination RPDO COB-ID

This command copies the COB-ID of the Source Node TPDO to the Destination Node RPDO. Please ensure that the PDO mapping parameter data fit together before executing this command. Otherwise it can result in communication failures and/or a malfunction of the Destination Node.
To change the PDO communication parameter or the PDO mapping parameter, please use the SDO command in the CIF or a CANopen® network configuration software.

→ **For the SDO write access command in the CIF, refer to Subsection 10.2.3**

→ **For the CANopen® configuration software, refer to the manual of the software to be used**

- Mode B TPDO/RPDO COB-ID Setup scenarios



BFM No.	Description		
	FROM (Read Access)	TO (Write Access)	
		High Byte	Low Byte
BFM #1000	H8301: Mapping successfully established H83FF: Parameter Error HFFFF: CIF Busy H000F: Error	Command: H8300	
BFM #1001	Diagnosis Data H0000: No Error All other values: The corresponding parameter caused an error. → **Refer to the Subsection 7.2.6**	Node ID number of Source 1	Specific TPDO of Source 1
BFM #1002		Node ID number of Destination 1	Specific RPDO of Destination 1
⋮		⋮	⋮
BFM #1063		Node ID number of Source 32	Specific TPDO of Source 32
BFM #1064		Node ID number of Destination 32	Specific RPDO of Destination 32
BFM #1065		Node ID number of Source 33	Specific TPDO of Source 33
BFM #1066		Node ID number of Destination 33	Specific RPDO of Destination 33

Note

With one execution of the Mode B COB-ID mapping command, up to 33 binding connections between CANopen® stations can be made. To establish more data connections, the command can be repeated as often as necessary.

IMPORTANT
If less than 33 bindings are used (max. number), the next BFM (n+1) needs to be terminated with HFFFF.

1. Source parameter

The Source parameter specifies the data telegram producer to be bound. It consists of two bytes, with the node ID in the high byte and the PDO number in the low byte.

- Node ID
  The node ID range is 1 to 127.
  The local FX3U-CAN can be specified by its actual node number or by using "0".
- TPDO number
  The TPDO number setting range is 1 to 255.
  The FX3U-CAN will read the TPDO COB-ID from the object dictionary of the source node. This COB-ID is written in the next step to the Destination node's RPDO communication parameter.

Example:
Source parameter = H1009
The high byte of the source parameter represents the node ID (H10). The low byte specifies TPDO 9. This node/TPDO will be bound to the node/RPDO in the destination BFM that directly follows the source BFM.

Note

An error will be generated if the Destination parameter is not configured.

2. Destination Parameter

The Destination parameter defines the destination for the corresponding source parameter data. It consists of two bytes, with the node ID in the high byte and the PDO number in the low byte.

- Node ID
  The node ID range is 1 to 127.
  The local FX3U-CAN can be specified by its actual node number or by using "0".
- RPDO number
  The RPDO number setting range is 1 to 255.
  The Destination node COB-ID is checked before the Source data is written to the communication parameter.

Example:
Destination parameter = H0203
The Source data will be bound to RPDO #3 of Node 2.

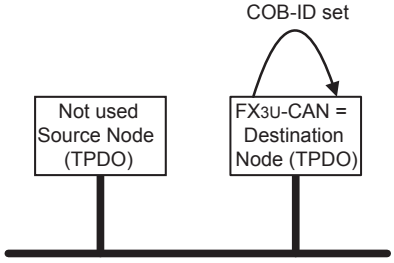
Note

An error message will be generated if the destination parameter is not configured.

Assign Additional TPDO COB-IDs to the Local Node

By default every CANopen® node uses four COB-IDs to exchange its data with other CANopen® stations. All COB-IDs for Data transmission are by default reserved for nodes 1 to 127. If it is necessary to transmit more than 4 PDOs (more than 16 words) from one node, this node must occupy COB-IDs of other (unused) stations. It is recommended to use the identifier of higher number stations for this purpose (127, 126, 125, etc). The lower the used COB-ID is, the higher the priority of the messages. Thus, assigning the COB-ID of TPDO4 from node 127 to highly important data should be avoided because all other TPDO COB-IDs have a higher priority for transmission on the CANopen® bus.
This command assigns the COB-ID of an unused TPDO of the Source Node to the defined TPDO of the local Node. Ensure that the Source Node doesn't exist in the network or that the Source Node TPDO is deactivated.

- Mode B TPDO/RPDO COB-ID Setup scenarios



BFM No.	Description		
	FROM (Read Access)	TO (Write Access)	
		High Byte	Low Byte
BFM #1000	H8301: Mapping successfully established H83FF: Parameter Error HFFFF: CIF Busy H000F: Error	Command: H8300	
BFM #1001	Diagnosis Data H0000: No Error All other values: The corresponding parameter caused an error. → **Refer to the Subsection 7.2.6**	Node ID number of Source 1	Specific TPDO of Source 1
BFM #1002		Destination Node ID: H80	Specific TPDO of local Node 1
⋮		⋮	⋮
BFM #1063		Node ID number of Source 32	Specific TPDO of Source 32
BFM #1064		Destination Node ID: H80	Specific TPDO of local Node 32
BFM #1065		Node ID number of Source 33	Specific TPDO of Source 33
BFM #1066		Destination Node ID: H80	Specific TPDO of local Node 33

Note

With one execution of the Mode B COB-ID mapping command, up to 33 binding connections between CANopen® stations can be made. To establish more data connections, the command can be repeated as often as necessary.

IMPORTANT
If less than 33 bindings are used (max. number), the next two BFMs (n+1 and n+2) need to be terminated with HFFFF.

1. Source parameter

The Source parameter defines the node which is the default "owner" of the COB-ID. It consists of two bytes, with the node ID in the high byte and the PDO number in the low byte.

- Node ID
  The node ID range is 1 to 127.
  The local FX3U-CAN can't be the Source.
- TPDO number
  The TPDO number setting range is 1 to 4.
  This COB-ID is written to the local node's PDO communication parameter. The TPDO COB-ID is equal to: H0180 + Source node ID for TPDO1, H0280 + Source node ID for TPDO2, H0380 + Source node ID for TPDO3, H0480 + Source node ID for TPDO4.

2. Destination Parameter

The Destination parameter defines the destination for the corresponding source parameter data. It consists of two bytes, with the node ID in the high byte and the PDO number in the low byte.

- Node ID
  The node ID must be set to H80.
- RPDO number
  The TPDO number setting range is 5 to 80.

Example:
Source = H7F01, Destination = H8005
The local FX3U-CAN module will use the COB-ID of TPDO1 from node 127 as its own TPDO5 (COB-ID H1FF = H180 + H7F).

Note

- For default COB-IDs used for TPDO 1 to 4, refer to Subsection 5.6.1.
- An attempt to assign a COB-ID to the first four PDO will cause an error.
- A setting of the Source Node ID to the local node number will cause an error.

7.2.6 Mode B COB-ID Mapping Errors

This subsection describes the parameter error H83FF occurring in mode B COB-ID Mapping.
If the CIF was not able to execute the "mode B COB-ID Mapping" command with the given parameter set, it will return H83FF in BFM #1000. BFM #1001 to #1066 will show which parameter caused the error(s).

Example:
If the source parameter 5 (BFM #1009) caused an error, the return value of BFM #1009 will not be H0000.

1. Source Parameter Errors

If an error occurs in the Source Parameters, the error code in the following table is stored in BFM #1001 to #1066 as diagnosis data. The "nn" part of the error code indicates Node ID, and the "mm" indicates PDO number.

Error No. (Hex)	Description
HFFFF	Node ID higher than 127, or PDO number is 0. Check the Node ID and PDO number.
Hnn00	No response from node "nn" (time out). Check the status of the Node ID "nn".
H00mm	COB-ID is H80000000 (PDO disabled)
Hnnmm	Node ID "nn" can not be accessed to PDO number "mm" in the communication parameter. Check that the PDO number is supported.

2. Destination Parameter Errors

If an error occurs in the Destination Parameters, the error code in the following table is stored in BFM #1001 to #1066 as diagnosis data. The "nn" part of the error code indicates Node ID, and the "mm" indicates PDO number.

Error No. (Hex)	Description
HFFFF	The following states are possible. Check the Node ID and PDO number. • Node ID higher than 127. • PDO number is 0. • The parameter may have been skipped if a Source error occurred.
Hnn00	No response from node ID "nn" (time out). Check the status of the Node ID "nn".
H00mm	Previous COB-ID of destination was H80000000. RPDO was disabled. Binding was accomplished, but there might be an error in the RPDO mapping parameter for the destination node.*1
Hnnmm	Node ID "nn" can not be accessed to PDO number "mm" in the communication parameter. Check the PDO number is supported.

*1. Please take care with this error message.
If the RPDO in the destination is disabled, it is uncertain whether there exists some mapping inside the destination node for this RPDO. This node might receive the data, but it is maybe not transferred to any I/O or data register.
When the Destination node is an FX3U-CAN, the PDO data will be mapped to a BFM (if the mapping parameter was not changed previously). In the case of the FX3U-CAN, the error can be judged as a warning that can be completely avoided if the mapping is done by the remote FX3U-CAN node itself.
Another possibility is to set the remote FX3U-CAN to Mode A mapping. In this case, RPDO 1 to 32 COB-IDs are different from H80000000. The disadvantage is that if all RPDO are mapped, they will also be received. This is not really a problem, but the FX3U-CAN cycle time will be a little bit longer, and it may be confusing if unused BFM are also changing their data values.

Note

If the local FX3U-CAN is the destination, error H00mm is disabled.

3. Other Errors

If the parameter is not set properly, the error code in the following table is stored in BFM #1001 to #1066 as diagnosis data. The "nn" part of the error code indicates Node ID and the "mm" indicates PDO number.

Error No. (Hex)	Description
Hnnmm	Source node ID "nn" must be in the range 1 to 127, PDO number "mm" must be 1 to 4 for the source parameter and 5 to 127 for the destination parameter.

8. CANopen® 417 Mode

This chapter describes the data transfer locations of the CANopen® 417 Mode.

For further information on application Profile CiA® 417 V2.1 for lift control systems, refer to the following section.

→ **Refer to Section 5.10**

Note

- The BFM data exchange will only be handled if the corresponding lift number bit in BFM #3000/13000 is set to ON.

  → **Refer to Subsection 5.10.1 and BFM #3000/13000 in the following table.**

- To ensure that the FX3U-CAN module can handle the CANopen® data in a consistent way, it is necessary to set BFM #20 bit 0, 8 or 9 (only Virtual input mapping) to ON before reading PDO data (FROM) and after writing PDO data (TO) to the module.
  The data exchange control signal ensures, by internal buffer exchange, that TO data from the PLC will be transmitted with its corresponding PDO at the same time.

  → **For BFM #20 bit 0, refer to Section 6.4**

- To activate the CiA® 417 Lift Application Profile mode, write into BFM #21 the value K417, set BFM #22 to K1 to store the BFM configuration and reset the Module.
- Only BFMs corresponding to the Lift Numbers for which the module is activated will be received and transferred.

  → **For the Lift number, refer to Subsection 5.10.1 and BFM #3000/13000 in the following table**

8.1 Buffer Memories Lists of Lift Application

This section explains data transfer locations for CANopen® 417 Mode. BFM #3000 to #3539, BFM #13000 to 13539 and BFM #12001 to 12539 are used as data transfer locations.

- General Setting

BFM No. and access type FROM/TO		Lift No.	Description	Initial value	Reference
BFM #3000	BFM #13000	1 to 8	Lift Number	H1	Section 8.2

- Call controller
  The call controller receives all call requests from the input panels, and transmits the corresponding acknowledgements to the output panels.

- Car drive controller
  The car drive controller transmits commands to the car drive unit. It receives status information from the car drive unit and the loadmeasuring unit. If the profile position mode is used, the car drive controller needs additional status information from the car position unit.
  The car drive controller uses the Door position which is also used by the car door controller.

8.2 Lift Number

This BFM contains the lift number to which the FX3U-CAN is assigned.
The Bit for the assigned lift number is set to ON (1).

Note

Only the application BFMs for which the Lift corresponding bit is set will be updated.

Data save to Flash ROM

Data can be saved in Flash ROM by CIF.

→ **For Store Object Dictionary Settings in the CIF, refer to Section 10.6**

BFM No.	Description										
	Bit 15	.....	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
BFM #3000 BFM #13000	Reserved			Lift 8	Lift 7	Lift 6	Lift 5	Lift 4	Lift 3	Lift 2	Lift 1

8.3 Virtual Input/Output Mapping

When BFM #3001 to #3003 and #12001 to #12003 are read, the virtual input mapping information is read from BFMs. When BFM #13001 to #13003 are read, the virtual output mapping information is read from BFMs. And when BFM #3001 to #3003 and #13001 to #13003 are written to, the virtual output mapping information is written to BFMs.

8.3.1 Virtual input mapping

These BFMs contain the last received input data from one of the digital input panel group objects.
Receive Ring Buffer for 252 messages. The oldest data will be shown as first.
The current numbers of messages in the receive Buffer can be read from BFM #3004 or #12004.
When the receive buffer is empty, BFM #3001 to #3003 or #12001 to #12003 shows the value H0.

BFM No.	Description					
	BFM #3003 BFM #12003		BFM #3002 BFM #12002		BFM #3001 BFM #12001	
	High Byte	Low Byte	High Byte	Low Byte	High Byte	Low Byte
BFM #3001 to #3003 BFM #12001 to #12003	Function data field	Door field	Floor field	Lift field	Sub-function field	Basic function field

1. Basic function field [Low byte in BFM #3001 and #12001]

BFM #3001 BFM #12001 Low Byte Value (hex)	Description
00	Reserved
01	Generic input
02	Standard hall call request
03	Low priority hall call request
04	High priority hall call request
05	Standard car call request
06	Low priority car call request
07	High priority car call request
08	Standard destination call
09	Low priority destination call
0A	High priority destination call
0B	Standard call to destination floor
0C	Low priority call to destination floor

BFM #3001 BFM #12001 Low Byte Value (hex)	Description
0D	High priority call to destination floor
0E	Special function
0F	Access code upload request
10	Speech connection request
11	Area monitoring connection request
12	Fire detector
13 to 15	Reserved
16	Status of safety-related circuitries (This is not safety-related information.)
17 to 1F	Reserved
20	Guest call
21 to 7F	Reserved
80 to FF	Manufacturer-specific

2. Sub-function field [High byte in BFM #3001 and #12001]

The Sub-function field interprets depending on the basic function field value.

Basic Function Field	Sub-Function Field	Description
BFM #3001 BFM #12001 Low Byte Value (hex)	BFM #3001 BFM #12001 High Byte Value (hex)	
01	00	Reserved
	01	Generic input 1
	⋮	⋮
	FE	Generic input 254
	FF	Reserved
02 to 04	00	Reserved
	01	Hall call up
	02	Hall call down
	03	Hall call
	04	Hall call extra up
	05	Hall call extra down
	06	Hall call extra
	07 to FF	Reserved
05 to 0D	00	Reserved
	01 to FE	Floor number 1 to 254
	FF	Reserved
0E	00	Reserved
	01	Request fan 1
	02	Request fan 2
	03	Request load time 1
	04	Request load time 2
	05	Key lock 1
	06	Key lock 2
	07	Key lock 3
	08	Key lock 4
	09	Request door open
	0A	Request door close
	0B	Fire recall (key switch hall panel)
	0C	Fire service (key switch car panel)
	0D	Hall call disable
	0E	Attendant service
	0F	VIP service
	10	Out of order
	11	Bed passenger service
0E	12	Special service
	13	Service run
	14	Dogging service enable
	15	Dogging service up
	16	Dogging service down
	17	Fire alarm (external fire alarm system)
	18	Provide priority
	19	Lift attendant start button
	1A	Lift attendant drive through button
	1B	Security run
	1C	Second call panel
	1D	Door enable
	1E	Call cancel button fire operation
	1F	Fire alarm reset
	20	Body detector (e.g. person in car)
	21	Earthquake detector
	22 to FF	Reserved
0F to 11	00 to FF	Reserved
12	00	Reserved
	01 to FE	Fire detector 1 to 254
	FF	Reserved
13 to 15	00 to FF	Reserved
16	00	Reserved
	01 to 03	Safety-related circuitry 1 to 3
	04	Hall/swing door
	05	Car door
	06	Door lock
	07 to FF	Reserved
17 to 1F	00 to FF	Reserved
20	00	Reserved
	01 to FE	Guest call 1 to 254
	FF	Reserved
21 to 7F	00 to FF	Reserved
80 to FF	00 to FF	Manufacturer-specific

3. Lift field [Low byte in BFM #3002 and #12002]

The bit for the requested lift number is set to ON (1).

BFM #3002 BFM #12002 Low Byte	Description							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
BFM #3002 Bit 0 to 7	Lift 8	Lift 7	Lift 6	Lift 5	Lift 4	Lift 3	Lift 2	Lift 1

4. Floor field [High byte in BFM #3002 and #12002]

BFM #3002 BFM #12002 High Byte Value (hex)	Description
00	Car panel
01 to FE	Panel of floor 1 to 254
FF	Reserved

5. Door field [Low byte in BFM #3003 and #12003]

This value provides the door number to which the sending virtual device is assigned. The structure of the field depends on the value of the basic function field.

Basic Function Field	Door Field	Description
BFM #3001 BFM #12001 Low Byte Value (hex)	BFM #3003 BFM #12003 Low Byte Bit No.	
00 to 07 or 0E to FF	Bit 0	Door 1
	Bit 1	Door 2
	Bit 2	Door 3
	Bit 3	Door 4
	Bit 4 to 7	Bit 4 to 7 fixed to OFF (0).
08 to 0D	Bit 0	Source door 1
	Bit 1	Source door 2
	Bit 2	Source door 3
	Bit 3	Source door 4
	Bit 4	Destination door 1
	Bit 5	Destination door 2
	Bit 6	Destination door 3
	Bit 7	Destination door 4

6. Function data field [High byte in BFM #3003 and #12003]

The function data provides the input state of a virtual input.

<table>
<tr><th>BFM #3003
BFM #12003
(High Byte)
Bit No.</th><th colspan="2">Description</th></tr>
<tr><td>Bit 8 and 9</td><td>Input state</td><td>
<table>
<tr><th>Bit 9</th><th>Bit 8</th><th>Description</th></tr>
<tr><td>OFF (0)</td><td>OFF (0)</td><td>Input state is OFF.</td></tr>
<tr><td>OFF (0)</td><td>ON (1)</td><td>Input state is ON.</td></tr>
<tr><td>ON (1)</td><td>OFF (0)</td><td>Function is defective</td></tr>
<tr><td>ON (1)</td><td>ON (1)</td><td>Function is not installed</td></tr>
</table>
</td></tr>
<tr><td>Bit 10 to 14</td><td colspan="2">Reserved</td></tr>
<tr><td>Bit 15</td><td>lock</td><td>OFF (0): Button or key-button has no locking function
ON (1): Button or key-button has locking function</td></tr>
</table>

8.3.2 Virtual output mapping

These BFMs contain the output data for one of the digital output group objects.

BFM No.	Description					
	BFM #3003 BFM #13003		BFM #3002 BFM #13002		BFM #3001 BFM #13001	
	High Byte	Low Byte	High Byte	Low Byte	High Byte	Low Byte
BFM #3001 to #3003 BFM #13001 to #13003	Function data field	Door field	Floor field	Lift field	Sub-function field	Basic function field

1. Basic function field [Low byte in BFM #3001 and #13001]

BFM #3001 BFM#13001 Low Byte Value (hex)	Description
00	Call controller commands
01	Generic output
02	Standard hall call acknowledgement
03	Low priority hall call acknowledgement
04	High priority hall call acknowledgement
05	Standard car call acknowledgement
06	Low priority car call acknowledgement
07	High priority car call acknowledgement
08	Standard destination call acknowledgement
09	Low priority destination call acknowledgement
0A	High priority destination call acknowledgement
0B	Standard call to destination floor acknowledgement
0C	Low priority call to destination floor acknowledgement
0D	High priority call to destination floor acknowledgement
0E	Special function acknowledgement
0F	Access code upload acknowledgement
10	Speech connection acknowledgement

BFM #3001 BFM #13001 Low Byte Value (hex)	Description
11	Area monitoring connection acknowledgement
12 to 1F	Reserved
20	Guest call acknowledgement
21 to 3F	Reserved
40	Position indication
41	Hall lantern
42	Direction indication
43	Special indication
44	Arrival indication
45	Operation data
46	Publicity indication
47	Speech synthesis
48 to 49	Reserved
4A	Miscellaneous outputs
4B to 7F	Reserved
80 to FF	Manufacturer-specific

2. Sub-function field [High byte in #3001 and #13001]

The Sub-function field is interpreted differently depending on the basic function field value.

Basic Function Field	Sub-Function Field	Description
BFM #3001 BFM #13001 Low Byte Value (hex)	BFM #3001 BFM #13001 High Byte Value (hex)	
00	00	Reserved
	01	Request all active hall calls
	02	Request all special inputs (basic functions 0E and 12)
	03 to FF	Reserved
01	00 to FF	Reserved
02 to 04	00	Reserved
	01	Hall call up acknowledgement
	02	Hall call down acknowledgement
	03	Hall call acknowledgement
	04	Hall call extra up acknowledgement
	05	Hall call extra down acknowledgement
	06	Hall call extra acknowledgement
	07 to FF	Reserved
05 to 0D	00	Reserved
	01 to FE	Target stop acknowledgement 1 to 254
	FF	All target stop buttons

Basic Function Field	Sub-Function Field	Description

3. Lift field [Low byte in BFM #3002 and #13002]

This value provides the lift number or the group of lifts, to which the output is assigned.

BFM #3002 BFM #13002 Low Byte	Description							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
BFM #3002 BFM #13002 Bit 0 to 7	Lift 8	Lift 7	Lift 6	Lift 5	Lift 4	Lift 3	Lift 2	Lift 1

4. Floor field [High byte in BFM #3002 and #13002]

BFM #3002 BFM #13002 High Byte Value (hex)	Description
00	Car panel
01 to FE	Floor number 1 to 254
FF	All floor panels

5. Door field [Low byte in BFM #3003 and #13003]

This value provides the door number to which the output is assigned. The structure of the field depends on the value of the basic function field. If the bits of the door field are set to 1, this shall indicate an assignment of the output to this door.

Basic Function Field	Door Field	Description
BFM #3001 BFM #13001 Low Byte Value (hex)	BFM #3003 BFM #13003 Low Byte Bit No.	
00 to 07 or 0E to FF	Bit 0	Door 1
	Bit 1	Door 2
	Bit 2	Door 3
	Bit 3	Door 4
	Bit 4 to 7	Bit 4 to 7 fixed to OFF (0).
08 to 0D	Bit 0	Source door 1
	Bit 1	Source door 2
	Bit 2	Source door 3
	Bit 3	Source door 4
	Bit 4	Destination door 1
	Bit 5	Destination door 2
	Bit 6	Destination door 3
	Bit 7	Destination door 4

6. Function data field [High byte in BFM #3003 and #13003]

The function data provides the input state of a virtual input.

BFM #3003 BFM #13003 (High Byte) Bit No.	Description	
Bit 8	Status	OFF (0): No data indicated (Does not apply for basic function H40) ON (1): Data indicated
Bit 9 to 11	Property	**Bit 9 to 11 value (hex)** H0: No action (default) H1: Output continuously H2: Output pulsed H3: Output flashing H4: Output coloured H5: Output with volume H6: Output with scroll rate H7: Reserved
Bit 12 to 14	Property parameter	Refer to table below
Bit 15	Predicate	OFF (0): Acknowledgement is not affirmed ON (1): Acknowledgement is affirmed

Value definition of the property parameter field (Bit 12 to 14)

Bit 12 to 14 value (hex)	Description						
	No action	Continuous	Pulsed	Flashing	Colour	Volume	Scroll rate
0	No action	Reserved	< 0.5 s	10 Hz	White	Minimum	Automatic
1			1 s	7.5 Hz	Yellow	Vary	1 line/s
2			1.5 s	5 Hz	Reserved	Vary	2 line/s
3			2 s	2 Hz	Green	Vary	3 line/s
4			3 s	1. 5Hz	Reserved	Vary	4 line/s
5			5 s	1 Hz	Red	Vary	5 line/s
6			10 s	0.5 Hz	Reserved	Vary	6 line/s
7			> 15 s	0.25 Hz	Blue	Maximum	7 line/s

8.4 Door Control Word/Door Status Word

When BFM #3050 to #3081 and #12050 to 12081 are read, the Door status word is read from BFMs. When BFM #13050 to #13081 are read, the Door control word is read from BFMs. And when BFM #3050 to #3081 and #13050 to #13081 are written to, the Door control word is written to BFMs.

8.4.1 Door control word

The Door control word contains the door commands and other control data.

Bit	15 ... 12	11 ... 10	9 ... 8	7 ... 6	5 ... 4	3 ... 2	1 ... 0
	Command	Door velocity	Motion detector	Finger protector	Door lock	Battery power	H3

1. Battery power field [Bit 2, 3]

Bit 3	Bit 2	Description
OFF(0)	OFF(0)	Battery power supply disabled
OFF(0)	ON (1)	Battery power supply enabled
ON (1)	OFF(0)	Reserved
ON (1)	ON (1)	Do not care / take no action

2. Door lock field [Bit 4, 5]

Bit 5	Bit 4	Description
OFF(0)	OFF(0)	Enable door lock
OFF(0)	ON (1)	Disable door lock
ON (1)	OFF(0)	Reserved
ON (1)	ON (1)	Do not care / take no action

3. Finger protector field [Bit 6, 7]

Bit 7	Bit 6	Description
OFF(0)	OFF(0)	Enable finger protector
OFF(0)	ON (1)	Disable finger protector
ON (1)	OFF(0)	Reserved
ON (1)	ON (1)	Do not care / take no action

4. Motion detector field [Bit 8, 9]

Bit 9	Bit 8	Description
OFF(0)	OFF(0)	Enable motion detector
OFF(0)	ON (1)	Disable motion detector
ON (1)	OFF(0)	Reserved
ON (1)	ON (1)	Do not care / take no action

5. Door velocity field [Bit 10, 11]

Bit 11	Bit 10	Description
OFF(0)	OFF(0)	Move door with standard speed
OFF(0)	ON (1)	Move door with reduced speed
ON (1)	OFF(0)	Reserved
ON (1)	ON (1)	Do not care / take no action

6. Command field [Bit 12 to 15]

Bit 12 to 15 Value (hex)	Description
0	Close door without limit force (Not allowed for EN-81 compliant lifts)
1	Close door with limit force
2	Nudging (Forced closing of car door with reduced speed without reversal devices due to the blocked door for too long time)
3	Open door without limit force (Not allowed for EN-81 compliant lifts)
4	Open door with limit force
5	Reserved
6	Reserved
7	Stop door without torque
8	Stop door with torque
9 to C	Reserved
D	Tech-in drive
E	Reset door
F	Do not care / take no action

8.4.2 Door status word

This Object contains the car door status and other status information.

Bit	15 ... 12	11 ... 10	9 ... 8	7 ... 6	5 ... 4	3 ... 2	1 ... 0
	Status	Force limit	Motion detector	Finger protector	Door lock	Battery power	Safety contact

1. Safety contact field [Bit 0, 1]

Bit 1	Bit 0	Description
OFF(0)	OFF(0)	Contact not closed
OFF(0)	ON (1)	Contact closed
ON (1)	OFF(0)	Error indicator
ON (1)	ON (1)	Not available or not installed

2. Battery power field [Bit 2, 3]

Bit 3	Bit 2	Description
OFF(0)	OFF(0)	No battery power used
OFF(0)	ON (1)	Battery power used
ON (1)	OFF(0)	Error indicator
ON (1)	ON (1)	Not available or not installed

3. Door lock field [Bit 4, 5]

Bit 5	Bit 4	Description
OFF(0)	OFF(0)	Door not locked
OFF(0)	ON (1)	Door locked
ON (1)	OFF(0)	Error indicator
ON (1)	ON (1)	Not available or not installed

4. Finger protector field [Bit 6, 7]

Bit 7	Bit 6	Description
OFF(0)	OFF(0)	No finger detected
OFF(0)	ON (1)	Finger detected
ON (1)	OFF(0)	Error indicator
ON (1)	ON (1)	Not available or not installed

5. Motion detector field [Bit 8, 9]

Bit 9	Bit 8	Description
OFF(0)	OFF(0)	Motion not detected
OFF(0)	ON (1)	Motion detected
ON (1)	OFF(0)	Error indicator
ON (1)	ON (1)	Not available or not installed

6. Force limit field [Bit 10, 11]

Bit 11	Bit 10	Description
OFF(0)	OFF(0)	Force limit not reached
OFF(0)	ON (1)	Force limit reached
ON (1)	OFF(0)	Error indicator
ON (1)	ON (1)	Not available or not installed

7. Status field [Bit 12 to 15]

Bit 12 to 15 Value (hex)	Description
0	Door closed with torque
1	Door closed without torque
2	Door is closing
3	Door opened with torque
4	Door opened without torque
5	Door is opening
6	Door is re-opening

Bit 12 to 15 Value (hex)	Description
7	Door stopped with torque (not in an end position)
8	Door stopped without torque (not in an end position)
9 to C	Reserved
D	Tech-in drive
E	Error indicator
F	Not available or not installed

Note

If the door is in an open or closed end position, this shall have higher priority than stopped status.

8.5 Door Position

These BFMs store the Door position information of each Lift number. The value is in units of mm. H0 value shows Closed and HFFFF shows "not available or not requested".

8.6 Light Barrier Status

These BFMs contain the status information of the VD light barrier unit for up to four doors.

<table>
<tr><th>Bit No.</th><th colspan="2">Description</th></tr>
<tr><td>Bit 0 to 5</td><td colspan="2">Bit 0 to 5 fixed to ON (1).</td></tr>
<tr><td>Bit 6 and 7</td><td>Status</td><td>
<table>
<tr><th>Bit 7</th><th>Bit 6</th><th>Description</th></tr>
<tr><td>OFF (0)</td><td>OFF (0)</td><td>No subject detected</td></tr>
<tr><td>OFF (0)</td><td>ON (1)</td><td>Subject detected</td></tr>
<tr><td>ON (1)</td><td>OFF (0)</td><td>Error indicator</td></tr>
<tr><td>ON (1)</td><td>ON (1)</td><td>Not available or not installed</td></tr>
</table>
</td></tr>
<tr><td>Bit 8 to 15</td><td colspan="2">Bit 8 to 15 fixed to OFF (0).</td></tr>
</table>

8.7 Position Value

These BFMs store the Position value (32 bit data) from the car position units of each Lift number. This value needs to be handled by 32 bit instructions.

The values shall be equivalent to object H6004 in the CiA® 406 specification.

8.8 Speed Value Car

These BFMs store the Speed value from the car position units of each Lift number.
The measuring step is defined in object H6384 of the car position unit.

8.9 Acceleration Value Car

These BFMs store the acceleration value from the car position units of each Lift number.
The measuring step is defined in Object H6384 of the car position unit.

8.10 Control Word/Status Word

When BFM #3428 to #3435 and #12428 to 12435 are read, the Status word is read from BFMs. When BFM #13428 to #13435 are read, the Control word is read from BFMs. And when BFM #3428 to #3435 and #13428 to #13435 are written to, the Control word is written to BFMs.

8.10.1 Control word

The Car drive Control word is based on object H6040 in the CiA® 402-2 V3.0 specifications.

Note

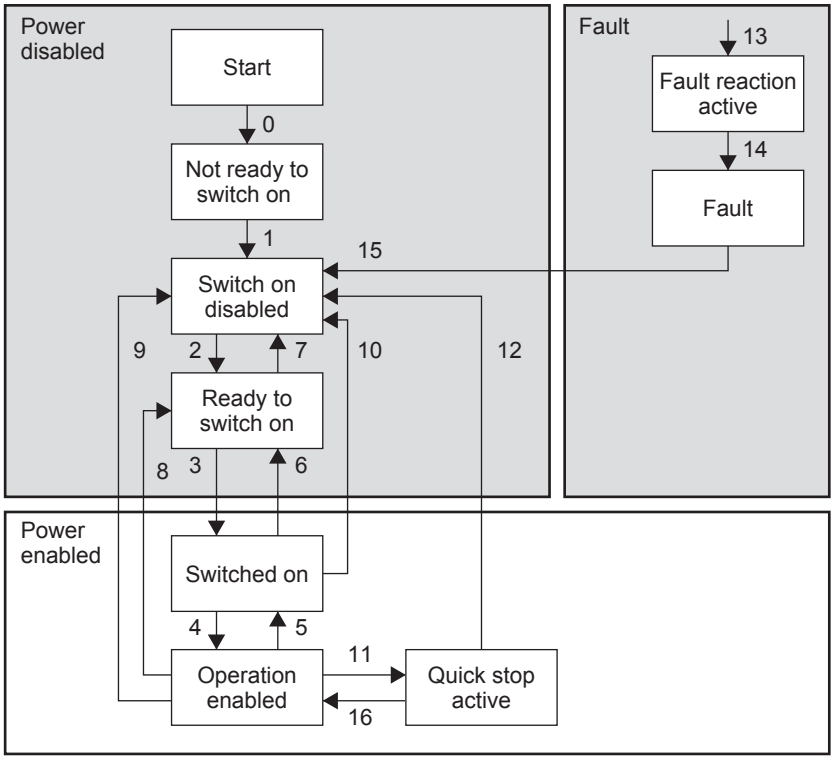
- Bits 4, 5, 6, and 9 of the control word are operation mode specific.
- The halt function (bit 8) behaviour is operation mode specific.
  If the bit is ON (1), the commanded motion shall be interrupted; the Power drive system shall behave as defined in the halt option code.
  After releasing the halt function, the commanded motion shall be continued if possible.

Bit	15	14	13 ... 11	10	9	8	7	6 ... 4	3	2	1	0
	insp	rcl	ms	H0	oms	h	fr	oms	eo	qs	ev	so

Bit	Item	Description
Bit 0	so	Switch on
Bit 1	ev	Enable voltage
Bit 2	qs	Quick stop
Bit 3	eo	Enable operation
Bit 4 to 6	oms	Operation mode specific
Bit 7	fr	Fault reset
Bit 8	h	Halt
Bit 9	oms	Operation mode specific
Bit 10	-	Bit 10 fixed to OFF (0).
Bit 11 to 13	ms	Manufacturer-specific
1Bit 4	rcl	OFF (0): Emergency recall operation mode inactive ON (1): Emergency recall operation mode active
Bit 15	insp	OFF (0): Car top inspection operation mode inactive ON (1): Car top inspection mode active

Status transition

Number: Transition No.



Command	Bits of the control word					Transition No.
	Bit 7	Bit 3	Bit 2	Bit 1	Bit 0	
Shutdown	0	X	1	1	0	2, 6, 8
Switch on	0	0	1	1	1	3
Switch on + enable operation	0	1	1	1	1	3 + 4 (Note)
Disable voltage	0	X	X	0	X	7, 9, 10, 12
Quick stop	0	X	0	1	X	7, 10, 11
Disable operation	0	0	1	1	1	5
Enable operation	0	1	1	1	1	4, 16
Fault reset	0 → 1	X	X	X	X	15

Note

- At the following Transition numbers occur a automatic status transition: 0, 1, 13, 14
- Automatic transition to enable operation state after executing SWITCHED ON state functionality.

8.10.2 Status word

This Car drive Status word is equivalent to object H6041 in the CiA® 402-2 V3.0 specification.

Bit	15 ... 14	13 ... 12	11	10	9	8	7	6	5	4	3	2	1	0
	ms	oms	ila	tr	rm	ms	w	sod	qs	ve	f	oe	so	rtso

Bit No.	Item	Description / set range
Bit 0	rtso	Ready to switch on
Bit 1	so	Switched on
Bit 2	oe	Operation enabled
Bit 3	f	Fault
Bit 4	ve	Voltage enabled ON when high voltage is applied to the Power drive system.
Bit 5	qs	Quick stop OFF When the Power drive system is reacting on a quick stop request.
Bit 6	sod	Switch on disabled
Bit 7	w	Warning ON when being a warning condition. The status of the Power drive system Finite state automaton will not be changed, as warning is not an error or fault.
Bit 8	ms	Manufacturer-specific
Bit 9	rm	Remote When this bit is ON, the control word is processed. If it is off (local), the control word is not processed.
Bit 10	tr	Target reached • ON when the Power drive system has reached the set-point. The set-point is operation mode specific. This Bit is set to on, if the operation mode has been changed. • ON if the quick stop option code is 5, 6, 7 or 8, when the quick stop operation is finished and the Power drive system is halted. • ON when halt occurred and the Power drive system is halted.
Bit 11	ila	Internal limit active ON when an internal limit is active.
Bit 12 to 13	oms	Operation mode specific
Bit 14 to 15	ms	Manufacturer-specific

Status Word	Power Drive System Finite State Automaton State
xxxx xxxx x0xx 0000 b	Not ready to switch on
xxxx xxxx x1xx 0000 b	Switch on disabled
xxxx xxxx x01x 0001 b	Ready to switch on
xxxx xxxx x01x 0011 b	Switched on
xxxx xxxx x01x 0111 b	Operation enabled
xxxx xxxx x00x 0111 b	Quick stop active
xxxx xxxx x0xx 1111 b	Fault reaction active
xxxx xxxx x0xx 1000 b	Fault

8.11 Modes of operation/Modes of operation display

When BFM #3436 to #3443 and #12436 to 12443 are read, the Modes of operation display is read from BFMs. When BFM #13436 to #13443 are read, the Modes of operation is read from BFMs. And when BFM #3436 to #3443 and #13436 to #13443 are written to, the Modes of operation is written to BFMs.

8.11.1 Modes of operation

This Car drive mode of operation is equivalent to object H6060 in the CiA® 402-2 V3.0 specifications.
Bits 8 to 15 are fixed to OFF (0). Even if set to ON (1), these bits will remain OFF (0).

Low byte Value (Dec)	Description
-128 to -1	Manufacturer-specific operation modes
0	No mode change or no mode assigned
+1	Profile position mode
+2	Velocity mode
+3	Profile velocity mode
+4	Torque profile mode
+5	Reserved
+6	Homing mode
+7	Interpolated position mode
+8	Cyclic sync position mode
+9	Cyclic sync velocity mode
+10	Cyclic sync torque mode
+11 to +127	Reserved

8.11.2 Modes of operation display

This Car drive mode of operation display is equivalent to object H6061 in the CiA® 402-2 V3.0 specifications.
This object provides the actual operation mode. Bits 8 to 15 are fixed to OFF (0) in these BFMs.
The value description can be shown in the Modes of operation.

→ **Refer to Subsection 8.11.1**

8.12 Control Effort

This Car drive control effort shall contain the breaking point or breaking distance depending on the target position given respectively as absolute value or relative value.
The value (32 bit data) shall be given in user-defined position units. It is necessary to read position value by 32 bit instructions.

8.13 Position Actual Value/Target Position

When BFM #3460 to #3475 and #12460 to 12475 are read, the Position actual value is read from BFMs. When BFM #13460 to #13475 are read, the Target position is read from BFMs. And when BFM #3460 to #3475 and #13460 to #13475 are written to, the Target position is written to BFMs.

8.13.1 Position actual value

This Car drive position actual value is equivalent to object H6064 in the CiA® 402-2 V3.0 specification and shall contain the position of the drive shaft. This information is used to calculate the slippage of the position unit. The value (32 bit data) shall be given in user-defined position units. This value needs to be handled by 32 bit instructions.

8.13.2 Target position

This Car drive target position is equivalent to object H607A in the CiA® 402-2 V3.0 specifications. This Target position contains the commanded position that the drive should move to in position profile mode using the current settings of the motion control parameters such as velocity, acceleration, deceleration, motion profile type etc. The value (32 bit data) shall be interpreted as absolute or relative depending on the 'abs/rel' flag in the control word. This value needs to be handled by 32 bit instructions. It shall be given in user-defined position units and shall be converted to position increments.

8.14 Profile Velocity

This Car drive profile Velocity is equivalent to object H6081 in the CiA® 402-2 V3.0 specifications. The value (32 bit data) is in units of mm/s.
This value needs to be handled by 32 bit instructions.

8.15 Velocity Actual Value/Target Velocity

When BFM #3492 to #3507 and #12492 to 12507 are read, the Velocity actual value is read from BFMs. When BFM #13492 to #13507 are read, the Target velocity is read from BFMs. And when BFM #3492 to #3507 and #13492 to #13507 are written to, the Target velocity is written to BFMs.

8.15.1 Target velocity

This Car drive target velocity is equivalent to object H60FF in the CiA® 402-2 V3.0 specifications. The value (32 bit data) is in units of mm/s.
This value needs to be handled by 32 bit instructions.

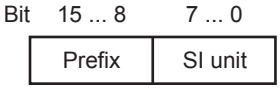
8.15.2 Velocity actual value

This Car drive velocity actual value is equivalent to object H606C in the CiA® 402-2 V3.0 specification. The value (32 bit data) is in units of mm/s.
This value needs to be handled by 32 bit instructions.

8.16 Load Value

These BFMs contain the Car drive load value and its related SI unit. The load value is the absolute value of the load (payload). It is in units of the configured SI unit. The load value of HFFFF shall be an error value that is applied if the sensor is in error state or does not have an actual value.

SI unit structure

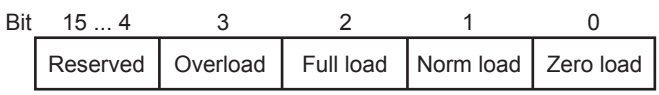


The default SI unit is kg. The SI unit and prefix field values shall use the coding as defined in the CiA® 303-2 specifications.

8.17 Load Signalling

These BFMs contain Car drive load signal information. It is used to signal measuring values of the load measuring system. Load signal contains different kinds of load signal. If one of the load bits (for zero load, norm load, full load, and overload) is set to ON (1), the related condition is true. If the bit is set to 0, the related condition is not true. Load signal interrupt contains the information about whether the related load bit shall be processed (1) or not (0).
Bits 8 to 15 are fixed to OFF (0) in these BFMs.

Load signal structure



9. CAN Layer 2 Mode

This chapter describes the data transfer locations and setting, etc. of the 11 bit/29 bit CAN-ID Layer 2 mode. In the 11 bit/29 bit CAN-ID Layer 2 mode, the FX3U-CAN can send/receive up to 42 pre-defined messages. Moreover, Layer 2 messages can be sent via CIF.

Difference between 11 bit/29 bit CAN-ID Layer 2 Modes

The bit numbers of the CAN-ID used in 11 bit/29 bit CAN-ID Layer 2 modes differ between 11 bit and 29 bit.

Note

- To ensure that the FX3U-CAN module can handle the CAN Layer 2 message in a consistent way, it is necessary to set BFM #20 bit 0 to ON before reading the received message (FROM) and after writing the transmitted message (TO) to the module.
  → **For BFM #20 bit 0, refer to Section 6.4**
- To activate the 11 bit/29 bit CAN-ID Layer 2 mode, write into BFM #21 the value K11 or K29, set BFM #22 to K1 to store the BFM configuration and reset the module.
  → **For module reset, refer to Section 6.8**
- BFMs (#0 to #19, #27, #50 to #59, #750 to #859, #900 to #963, and #3000 to #3539), which are active in the CANopen® 405 mode or CANopen® 417 mode, are not active and not accessible in CAN Layer 2 Mode.

9.1 Receive/Transmit Process Data

The data transfer locations of the 11 bit/29 bit CAN-ID Layer 2 mode are as follows.

Note

The following settings of each message have to be defined in Layer 2 configuration mode, before shifting to the Layer 2 online mode.

- The CAN-ID LW, CAN-ID HW and transmitting data byte number (in RTR/new/DLC) in the following BFMs
- Layer 2 message configuration in BFM #1100 to #1276
  Sets the parameters (transmitting/receiving message, etc.) for each message.
  → **For Layer 2 message configuration in BFM #1100 to #1267, refer to Section 9.3**

BFM No.	Name	Description			Initial value	Read/ Write	Stored to Flash ROM
		High Byte	Low Byte				
BFM #0 to #19	Reserved				-	-	-
BFM #100	CAN-ID 1 LW	11/29 bit CAN-Identifier low word		Layer 2 message 1	HFFFF	R/W	✓*1
BFM #101	CAN-ID 1 HW	29 bit CAN-Identifier high word			HFFFF	R/W	✓*1
BFM #102	RTR / new / DLC	High Byte: Remote Transmission Request Low Byte: Data length count			H0	R/W	✓*1
BFM #103	Data bytes	2nd data byte	1st data byte		H0	R/W*2	-
BFM #104		4th data byte	3rd data byte		H0	R/W*2	-

BFM #393		8th data byte	7th data byte		H0	R/W*2	-
BFM #394 to #399	Reserved				-	-	-

*1. These BFM will be stored into the Flash ROM when the save command is executed.
→ **For the save command, refer to Section 6.6**

*2. Receive messages are read only, transmit messages can be read and written.

1. When transmitting messages

The CAN-ID, RTR/new/DLC and data bytes of each message are as follows.

1) CAN-ID
The destination of the message is specified by CAN-ID. CAN-ID is as follows, corresponding to the function mode to be used.

→ **For function mode, refer to Section 6.5**

Function Mode	Description
11 bit CAN-ID Layer 2 Mode	Store CAN-ID in the 11 bits, bit 0 to 10, in the CAN-ID n*2 LW. In this function mode, CAN-ID n*2 HW are ignored.
29 bit CAN-ID Layer 2 Mode	Store CAN-ID in the 29 bits, bit 0 to 28, in the CAN-ID n*2 LW and CAN-ID n*2 HW. Handle CAN-ID n*2 LW and CAN-ID n*2 HW by 32 bit instructions.

*2. The "n" corresponds to the Layer 2 message number.

2) RTR/new/DLC
RTR/new/DLC is set as follows.

High Byte/Low Byte	Description
High byte	Bit 12 ON: Strict DLC check for RTR Bit 15 OFF: Send data frame Bit 15 ON: Send RTR frame*3
Low byte	Number of data bytes to transmit (K0 to K8)*3

*3. Bit 15 defines whether the message is transmitted as a data frame (Bit 15 = OFF) or a Remote Transmit Request frame (Bit 15 = ON). Bit 12 = ON enables a strict DLC check for received RTR frames. If Bit 12 is OFF, only the CAN-ID of an inbound RTR frame is checked for a match with a user message; if the bit is ON, the CAN-ID and the DLC of the RTR frame must match the user message to cause a response or BFM #1270 to #1272 flag to be set.
Bit 15 and Bit 12 cannot be set ON at the same time.
Bit 15 can be set ON if the parameter B is set to H5FFF.
Bit 12 can be set ON if the parameter B is set to H6FFF or H7FFF.

→ **For parameter B, refer to Section 9.3**

3) Data bytes
Store the data to transmit. The data length of the transmit data is set by DLC.

2. When receiving messages

The CAN-ID, RTR/new/DLC and data bytes of each message are as follows.

Note

In case more than one ID can pass the filter set in BFM #1100 to #1267, the received CAN-ID might change and will always display the CAN-ID, DLC and data of the latest received message.

→ **For Layer 2 message configuration in BFM #1100 to #1267, refer to Section 9.3**

1) CAN-ID

The source CAN-ID of the received Layer 2 message is stored. CAN-ID is as follows corresponding to the function mode to be used.

→ **For the function mode, refer to Section 6.5**

Function Mode	Description
11 bit CAN-ID Layer 2 Mode	CAN-ID is stored in the 11 bits, bit 0 to 10, in the CAN-ID n*1 LW. In this function mode, CAN-ID n*1 HW does not used.
29 bit CAN-ID Layer 2 Mode	CAN-ID is stored in the 29 bits, bit 0 to 28, in the CAN-ID n*1 LW and CAN-ID n*1 HW. Handle CAN-ID n*1 LW and CAN-ID n*1 HW by 32 bit instructions.

*1. The "n" corresponds to the Layer 2 message number.

2) RTR/new/DLC

High Byte/Low Byte	Description
High byte	H00: New data is not received. Bit 8: ON when new data is received. Bit 9: ON when new frame is received. Bit 10: ON when overflowing.*2
Low byte	Data length count (DLC) of the received CAN frame.

*2. If bit 8 of the RTR/new/DLC is ON, a new message including new data has been received and stored. If bit 9 is ON but bit 8 is OFF, the same message (same ID, DLC and data) has been received. If bit 10 is ON, at least one more message has been stored in this message buffer while bit 8 was ON which caused an overflow condition.

Flags RTR / new / DLC	Receive messages only				
	New frame no new data	New frame new data	New frame no new data overflow occur	New frame new data overflow occur	No data received
New data (bit 8)	OFF	ON	OFF	ON	- (Do not care)
New frame (bit 9)	ON	ON	ON	ON	OFF
Overflow (bit 10)	OFF	OFF	ON	ON	- (Do not care)

3) Data bytes

The data received of length specified by DLC is stored.
In case the received DLC is less than 8, unused data bytes are set to H00.

9.2 Layer 2 Message Specific Error Code List

This List contains an error message for each Layer 2 message.

BFM No.	Detailed Error Code for Each Layer 2 Message
BFM #401	Message 1 error code
BFM #402	Message 2 error code
⋮	⋮
BFM #442	Message 42 error code

Error code in Layer 2 message

Error Code	Error Code Description
H0000	No error
H2000	Receive buffer overflowed

9.3 Pre-defined Layer 2 Message Configuration

This section describes the Pre-defined Layer 2 message configuration.
The parameters of Layer 2 message number are used to define if the corresponding Layer 2 message number in BFM #100 to #393 is a transmit or receive message.

Note

- The Pre-defined Layer 2 message configuration can be set in Layer 2 configuration mode (BFM #25 bit 4 is OFF).

→ **For the communication status (BFM #25), refer to Section 6.8**

- If an invalid value is written to one of BFM #1100 to #1267, then BFM #29 bit 6 is set, and the BFM address is displayed in BFM #39.
- If the Layer 2 message number is not used, parameter A and B should be set to HFFFF.

BFM No.	Name	Description	Initial value	Read/Write
BFM #1100	Layer 2 message 1 parameter A	Layer 2 message 1 parameter	HFFFF	R/W
BFM #1101	Layer 2 message 1 parameter B		HFFFF	R/W
BFM #1102	Layer 2 message 1 parameter C		H0000	R/W
BFM #1103	Layer 2 message 1 parameter D		H0000	R/W
BFM #1104	Layer 2 message 2 parameter A	Layer 2 message 2 parameter	HFFFF	R/W
BFM #1105	Layer 2 message 2 parameter B		HFFFF	R/W
BFM #1106	Layer 2 message 2 parameter C		H0000	R/W
BFM #1107	Layer 2 message 2 parameter D		H0000	R/W
⋮	⋮	⋮	⋮	⋮
BFM #1260	Layer 2 message 41 parameter A	Layer 2 message 41 parameter	HFFFF	R/W
BFM #1261	Layer 2 message 41 parameter B		HFFFF	R/W
BFM #1262	Layer 2 message 41 parameter C		H0000	R/W
BFM #1263	Layer 2 message 41 parameter D		H0000	R/W
BFM #1264	Layer 2 message 42 parameter A	Layer 2 message 42 parameter	HFFFF	R/W
BFM #1265	Layer 2 message 42 parameter B		HFFFF	R/W
BFM #1266	Layer 2 message 42 parameter C		H0000	R/W
BFM #1267	Layer 2 message 42 parameter D		H0000	R/W

9.3.1 Pre-defined Layer 2 transmit messages

This subsection describes parameters A to D for the transmit message.

Parameter	Description	Initial value
Layer 2 message number parameter A	Constant HFFFF	HFFFF
Layer 2 message number parameter B	H7FFF (auto RTR response) H6FFF (manual RTR response) H5FFF (disable RTR handling) HFFFF (message disabled)	HFFFF
Layer 2 message number parameter C	Transmission type	H0000
Layer 2 message number parameter D	Cycle time in [10 ms]	H0000

1. Parameter A and B for each Layer 2 message

A message buffer in BFM #100 to #393 is assigned to a Layer 2 transmit message by writing HFFFF in parameter A, and writing H7FFF, H6FFF or H5FFF in parameter B.
When Layer 2 message number is not used, set HFFFF to both parameter A and B.

Note

The Layer 2 implementation of the FX3U-CAN can handle up to 28 transmit slots with RTR handling (parameter B = H7FFF or H6FFF). If the configuration violates this rule, the first 28 transmit message configurations remain as they are, and RTR handling is disabled for any further transmit messages as parameter B is forced to H5FFF.

→ **For the RTR message reception list, refer to Section 9.4**

- When using the auto RTR response
  Set H7FFF to parameter B for the Layer 2 message.
  The FX3U-CAN automatically responds to Remote Transmit Requests (RTRs) if the 11/29 bit CAN-ID (i.e. set in BFM #100) matches the ID in the RTR message.
  The RTR message is not stored to the RTR flag list.
- When using the manual RTR response
  Set H6FFF to parameter B for the Layer 2 message.
  The FX3U-CAN will not automatically respond to Remote Transmit Requests, but the RTR ID will be added to the RTR flag list.
- When using the disable RTR handling
  Set H5FFF to parameter B for the Layer 2 message.
  The FX3U-CAN will discard any incoming RTR telegrams matching the CAN-ID of this Layer 2 message.

2. Parameter C "transmission type" for each Layer 2 message

The transmission type defines the transmit/receive message and transmission trigger event of the message as follows.

Transmission Type value	Message Type	Transmission Trigger Event
K0	Transmit message	When BFM #20 bit 0 is set to ON, the Layer 2 message is always transmitted.
K1		When BFM #20 bit 0 is set to ON, the Layer 2 message is transmitted. However, if data has not been changed, it is not transmitted.
K2		The Layer 2 message transmits with following condition. • With a cycle time set by parameter D • BFM #20 bit 0 set to ON
K3		The Layer 2 message transmits with following condition. However, if data has not been changed, it is not transmitted. • With a cycle time set by parameter D • BFM #20 bit 0 set to ON
K4		The Layer 2 message transmits with following condition. • Request via RTR frames Request via RTR frames works for maximum 28 transmit messages. • Message transmit trigger flags The Layer 2 message transmits when the corresponding message transmit trigger flag in BFM #1280 to #1282 is set to ON. → **For the message transmit trigger flag, refer to Section 9.5**

3. Parameter D "cycle time" for each Layer 2 message

This parameter is used when the transmission type (event) is set to K2 or K3.
The cycle time is in units of ms

Note

- The cycle time should be set in consideration of the PLC scan cycle and communications response time, etc.
- If cycle time is set to K0, cycle time operates as 1 ms.

9.3.2 Pre-defined Layer 2 receive messages

This subsection describes parameters A to D for the receive message.

Parameter	Description	Initial Value
Layer 2 message number parameter A	Reception CAN-ID low word	HFFFF
Layer 2 message number parameter B	Reception CAN-ID high word	HFFFF
Layer 2 message number parameter C	Reception ID filter bit mask low word	H0000
Layer 2 message number parameter D	Reception ID filter bit mask high word	H0000

1. Parameter A and B for each Layer 2 message

Set the source CAN ID of the received message to parameter A and B. CAN-ID is as follows, corresponding to the function mode to be used.
When Layer 2 message number is not used, set HFFFF to both parameter A and B.

→ **For function mode, refer to Section 6.5**

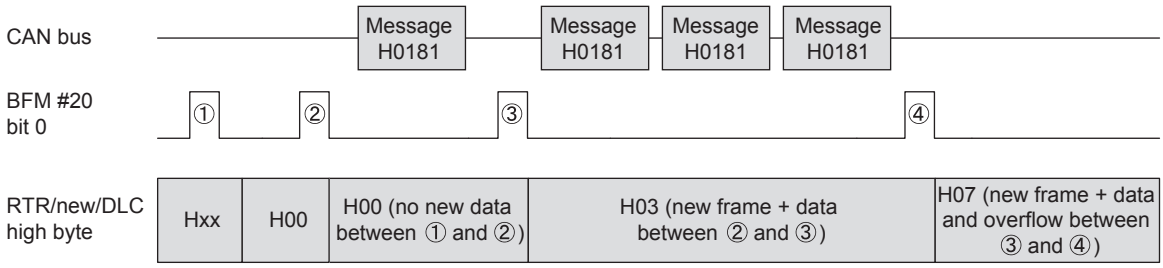
Function Mode	Description
11 bit CAN-ID Layer 2 Mode	Store CAN-ID in the 11 bits, bit 0 to 10, in the parameters A and B by 32 bit instructions.
29 bit CAN-ID Layer 2 Mode	Store CAN-ID in the 29 bits, bit 0 to 28, in the parameters A and B by 32 bit instructions.

2. Parameter C and D for each Layer 2 message

Set the filter for the ID set in parameter A and B. If the filter is set to H00000000, incoming messages are checked for an exact match with the ID set in parameter A and B. Any bit set in the filter will be omitted when comparing received IDs with the ID set in parameter A and B.

Example 1:
Layer 2 message 1 parameter A/B = H00000181
Layer 2 message 1 parameter C/D = H00000000

BFM #100 to #106 store received messages with the CAN-ID H181 only. Relation between received CAN message, BFM #20 bit 0 and "RTR/new/DLC" high byte is shown below.



The flags "RTR/new/DLC" are cleared by PLC program after ①. They remain H00 after ②, because there was no message stored between ① and ②. The first received CAN message that matches parameter A/B and C/D is stored into the internal buffers, and as this is the only message between ② and ③, the high byte value is set to H03. The high byte value H07 after ④ shows that the buffer was overwritten at least once (in this example two times) since ③. The data bytes in the BFM are the data received with the last message.

Note

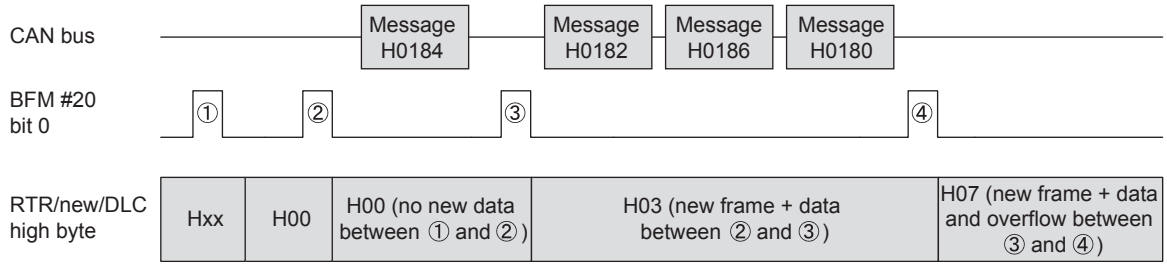
In this example, it is expected that the PLC program resets the “RTR/new/DLC” flags after reading the data at ①, ②, ③ and ④.

Example 2:
Layer 2 message 2 parameter A/B = H00000180
Layer 2 message 2 parameter C/D = H00000006

BFM #107 to #113 stores received messages with CAN-IDs H180, H182, H184 and H186 because ID bits 1 and 2 are not evaluated. Relation between received CAN message, BFM #20 bit 0 and "RTR/new/DLC" high byte is shown below.

Note

Please remember that in this case all four messages are stored in the same location! If more than one of the messages with ID H180, H182, H184 or H186 is received between two write operations BFM #20 = K1, only the last received CAN-ID, DLC, and data is available in BFM #107 to #113.



Behaviour until ④ is similar to that described in example 1.

Same as in the first example, the high byte value H07 after ④ shows that the buffer was overwritten at least once, since ③ and the data bytes in the BFM are also the data received with the last message.
But this time, it is required to check the 11 bit CAN-ID in the corresponding Layer 2 message (BFM #100 to #399) to determine which message ID was received. In this case the last message is H0180, and the data of this message is stored to the data BFM. The data of messages H0182 and H0186 are lost.

Note

In this example, it is expected that the PLC program resets the “RTR/new/DLC” flags after reading the data at ①, ②, ③ and ④.

9.4 Layer 2 RTR Flags

If the FX3U-CAN is set to Layer 2 communication mode, an incoming RTR message is indicated in the BFM if the following conditions are satisfied:

- Matching the "CAN-ID n*1" of one of the Layer 2 messages
- The Layer 2 message "n*1" is configured as a transmit Layer 2 message
- The Layer 2 message "n*1" is set to "no auto RTR response" (H6FFF)

*1. Where "n" is one of the Layer 2 messages 1 to 42.

The bits in the "RTR message reception list" are updated independently from BFM #20 bit 0.
A bit is set if a valid RTR message has been received. The bit can be evaluated by PLC program and required changes to the response message data can be made (BFM #20 bit 0 must be set in order to refresh the internal data buffer and trigger the transmission). The flag is automatically reset when a message is transmitted from the Layer 2 message.

RTR message reception list

BFM No.	Bit No.	Description	Read/Write
BFM #1270	Bit 0	RTR message for Layer 2 message 1 received	R
	⋮	⋮	R
	Bit 15	RTR message for Layer 2 message 16 received	R
BFM #1271	Bit 0	RTR message for Layer 2 message 17 received	R
	⋮	⋮	R
	Bit 15	RTR message for Layer 2 message 32 received	R
BFM #1272	Bit 0	RTR message for Layer 2 message 33 received	R
	⋮	⋮	R
	Bit 9	RTR message for Layer 2 message 42 received	R
	Bit 10	Unused	R
	⋮		
	Bit 15		

9.5 Message Transmit Trigger Flags

The transmission of a message in Layer 2 mode can be triggered via the following flags.
Transmit requests on receive Layer 2 messages are discarded. When a bit is set to ON, the corresponding transmit message will be sent as soon as a transmit buffer is available. The flags are reset automatically as soon as the message is written into the transmit buffer.

BFM No.	Bit No.	Transmit request Layer 2 message	Remarks
BFM #1280	Bit 0	Layer 2 message 1	R/W
	⋮	⋮	R/W
	Bit 15	Layer 2 message 16	R/W
BFM #1281	Bit 0	Layer 2 message 17	R/W
	⋮	⋮	R/W
	Bit 15	Layer 2 message 32	R/W
BFM #1282	Bit 0	Layer 2 message 33	R/W
	⋮	⋮	R/W
	Bit 9	Layer 2 message 42	R/W
	Bit 10 to 15	Reserved	R/W

9.6 PLC RUN>STOP Messages

FX3U-CAN can transmit the message according to its state, if the PLC is in one of the following two states. Up to four transmit messages can each be registered.

- If PLC state had changed to STOP from RUN, or FROM/TO Watchdog in FX3U-CAN has been timed-out
  In this case, the message registered into RUN>STOP messages 1 to 4 are transmitted.

Warning

Depending on PLC Type and baud rate and bus load, FX3U-CAN may be unable to send the message. In such a case, additional H/W and/or S/W should be considered for safe system behavior.
If possible use only one "RUN>STOP message" which will increase the possibility that the information is transmitted in the event "RUN>STOP" occurs.
If more than one message is defined, messages are transmitted in order of priority "message 1" to "message 4".

Note

- The time differs depending on the number of I/Os and on the number and types of extension blocks.

BFM No.	Function	Description		Layer 2 Message	Initial Value
		High Byte	Low Byte		
BFM #1900	CAN-ID 1 LW	11/29 bit CAN-Identifier low word		RUN>STOP message 1	HFFFF
BFM #1901	CAN-ID 1 HW	29 bit CAN-Identifier high word			HFFFF
BFM #1902	DLC	Data length count			H0
BFM #1903	Data bytes	2nd data byte	1st data byte		H0
BFM #1904		4th data byte	3rd data byte		H0
BFM #1905		6th data byte	5th data byte		H0
BFM #1906		8th data byte	7th data byte		H0
⋮	⋮	⋮		⋮	⋮

BFM No.	Function	Description		Layer 2 Message	Initial Value
		High Byte	Low Byte		
BFM #1921	CAN-ID 4 LW	11/29 bit CAN-Identifier low word		RUN>STOP message 4	HFFFF
BFM #1922	CAN-ID 4 HW	29 bit CAN-Identifier high word			HFFFF
BFM #1923	DLC	Data length count			H0
BFM #1924	Data bytes	2nd data byte	1st data byte		H0
BFM #1925		4th data byte	3rd data byte		H0
BFM #1926		6th data byte	5th data byte		H0
BFM #1927		8th data byte	7th data byte		H0

BFM Function	Description
11/29 bit CAN-ID n	CAN-ID is used to transmit this message into the network. Sets HFFFF to the CAN-ID n LW and CAN-ID n HW when not using the message.
DLC	High byte H00 = send data frame*1
	Low byte = number of data bytes to transmit (K0 to K8)
Data bytes	Data bytes 1 to 8. Number of attached data bytes is defined by DLC.

*1. RTR is prohibited for these messages.

9.7 CIF Sending Layer 2 Message

Using this function, the FX3U-CAN can send any Layer 2 messages to the CAN bus. This function is accessible only in Layer 2 Mode.

Execution procedure: Set Node guarding/NMT Slave Assignment

1) Write the CAN-ID, RTR, DLC and the data byte to BFM #1001 to #1008.
2) Write the command code H000C to BFM #1000.
   When the command code H000C is written to BFM #1000, the command is executed.
3) When the executed command is successful, H000D is written to BFM #1000.

→ **If H000F or HFFFF is read from BFM #1000, refer to Section 10.9**

BFM No.	Description		
	FROM (Read Access)	TO (Write Access)	
		High Byte	Low Byte
BFM #1000	H000D: Data written to transmit buffer HF00C: Setting Error HFFFF: CIF Busy H000F: Error	Command: H000C	
BFM #1001	Diagnosis Data H0000: No Error HF00C: Setting Error Displays the error cause. All other values: The corresponding parameter caused an error.	11/29 bit CAN-Identifier low word	
BFM #1002		29 bit CAN-Identifier high word	
BFM #1003		RTR (Remote Transmission Request)*1	
BFM #1004		DLC (Data Length Count)*2	
BFM #1005	Unused	2nd data byte	1st data byte
BFM #1006		4th data byte	3rd data byte
BFM #1007		6th data byte	5th data byte
BFM #1008		8th data byte	7th data byte
BFM #1009 to #1066		Unused	

*1. Set this BFM to K0 for normal transmission. If this BFM is set to K1, a remote transmit request frame is sent. This request makes the producer of the associated CAN-ID specified in BFM #1001 and #1002 send the actual data.

*2. The data length in bytes (0 to 8).

10. Command Interface

This chapter describes the Command Interface supported by FX3U-CAN. Command Interface that can be used with each Function Mode is shown in the following table.

Command Interface	Function Mode Selection				Reference
	Mode 405	Mode 417	Mode 11	Mode 29	
SDO Request	✓	✓	-	-	Section 10.2
Set Heartbeat	✓	✓	-	-	Section 10.3
Set Node Guarding / NMT slave assignment	✓	✓	-	-	Section 10.4
Send an Emergency Message	✓	✓	-	-	Section 10.5
Store Object Dictionary settings	✓	✓	-	-	Section 10.6
Restore Object Dictionary default settings	✓	✓	-	-	Section 10.7
Communication Mapping Modes	✓	-	-	-	Section 7.2
Display current Parameter	✓	✓	✓	✓	Section 10.8
Sending Layer 2 Message	-	-	✓	✓	Section 9.7

10.1 [BFM #1000 to #1066] Command Interface

The Command Interface (CIF) can be used to access the Object Dictionary of the local node or a network node. Access is performed by commands for SDO read/write, special direct command for Node Guarding, Heartbeat, PDO Mapping or Emergency Messages.

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	Command execution result code	Command code (trigger for command execution)
BFM #1001 to #1066	Command parameter read back or detailed error information	Command parameter

Note

- The TO buffer will not be cleared after command execution. The former written TO data will be display by making new TO accesses or using the Display current Parameter command.

→ **Refer to Section 10.8**

- Check always before a TO access to the CIF if the BFM #1000 does not display HFFFF (CIF Busy)!
  If a TO access occurs during CIF busy, it will generate a “Command or Parameter change while CIF was busy” error.

→ **Refer to Subsection 10.9.1**

10.2 SDO Request

Note that the NMT Master startup process uses SDO's which can be result in an Error of the CIF command if the NMT Startup Master accesses the remote Node at the same time.

10.2.1 CIF SDO read access

Description of CIF SDO read access is shown below.
The local FX3U-CAN can be specified by its actual node number or by using "0".

Execution procedure: CIF SDO read access

1) Write the Node number and the Index / Sub-index of the target Object Dictionary to BFM #1001 to #1003.
2) Write the command code H0004 for SDO read access to BFM #1000.
   When the command code H0004 is written to BFM #1000, the command is executed.
3) When the executed command is successful, H0005 is written to BFM #1000.
   → **If H000F or HFFFF is read from BFM #1000, refer to Section 10.9**
4) When H0005 is read from BFM #1000, the specified byte length (BFM #1004) of the result data from BFM #1005 is read. A maximum of 124 bytes of result data is stored in BFM #1005 to #1066.

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H0005: SDO read success H000F: Error HFFFF: CIF Busy	Command H0004: SDO read
BFM #1001	Node number (read back)	Node number
BFM #1002	Index (read back)	Index
BFM #1003	Sub-index (read back)	Sub-index
BFM #1004	Data length	Unused
BFM #1005 to #1066	Result data	Unused

Result Data Structure in BFM #1005 to #1066

BFM No.	Description	
	High Byte	Low Byte
BFM #1005	2nd data byte	1st data byte
BFM #1006	4th data byte	3rd data byte
BFM #1007	6th data byte	5th data byte
BFM #1008	8th data byte	7th data byte
⋮	⋮	⋮
BFM #1065	122nd data byte	121st data byte
BFM #1066	124th data byte	123rd data byte

10.2.2 CIF Multi SDO read access

With the multi SDO read access command, up to 8 SDO read accesses can be made within one command. The maximum data length for each access is 8 bytes.
At first write the node number (0, 1-127), the Object Dictionary Index and the Sub index to the BFMs. Finally the command code for multi SDO read access "8" must be written to BFM #1000 in order to trigger the command execution.
If the access has been successful, BFM #1000 will display "9" and BFM #1001 to #1064 will contain the node number, index and sub index for verification purposes.

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H0009: SDO read success H000F: Error (refer to Section 10.9) H00F9: Error (show Node number and Result data for details) HFFFF: CIF Busy	Command H0008: SDO Multi read
BFM #1001	Success: Node number (read back) Error: High Byte H0F, Low Byte Node number (read back)	Node number
BFM #1002	Index (read back)	Index
BFM #1003	Sub-index (read back)	Low byte: Sub index High byte: reserved
BFM #1004	Success: Data length Error: H0	Unused
BFM #1005	Success: Result data Error: SDO access error code	
BFM #1006		
BFM #1007		
BFM #1008		
⋮	⋮	⋮
BFM #1057	Success: Node number (read back) Error: High Byte H0F, Low Byte Node number (read back)	Node number*1
BFM #1058	Index (read back)	Index
BFM #1059	Sub-index (read back)	Low byte: Sub index High byte: reserved
BFM #1060	Success: Data length Error: H0	Unused
BFM #1061	Success: Result data Error: SDO access error code	
BFM #1062		
BFM #1063		
BFM #1064		
BFM #1065 to #1066	Unused	Unused

*1. If the final setting is located before BFM #1057, write HFFFF in the last BFM (Node number).

10.2.3 CIF SDO write access

Description of CIF SDO write access is shown below.
The local FX3U-CAN can be specified by its actual node number or by using "0".

Execution procedure: CIF SDO write access

1) Write the Node number and the Index / Sub-index of the target Object Dictionary to BFM #1001 to #1003.
2) Write the data length (in bytes) to be written, to BFM #1004, and the data to be written, to BFM #1005 to # 1066.
3) Write the command code H0002 for SDO write access to BFM #1000.
When the command code H0002 is written to BFM #1000, the command is executed.
4) When the executed command is successful, H0003 is written to BFM #1000.
→ **If H000F or HFFFF is read from BFM #1000, refer to Section 10.9**

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H0003: SDO write success HFFFF: CIF Busy H000F: Error → **Refer to Section 10.9**	Command H0002: SDO write
BFM #1001	Node number (read back)	Node number
BFM #1002	Index (read back)	Index
BFM #1003	Sub-index (read back)	Sub-index
BFM #1004	Unused	Data length (in byte)
BFM #1005 to #1066	Unused	Command parameter data

Command Parameter Data Structure in BFM #1005 to #1066

BFM No.	Description	
	High Byte	Low Byte
BFM #1005	2nd data byte	1st data byte
BFM #1006	4th data byte	3rd data byte
BFM #1007	6th data byte	5th data byte
BFM #1008	8th data byte	7th data byte
⋮	⋮	⋮
BFM #1065	122nd data byte	121st data byte
BFM #1066	124th data byte	123rd data byte

Example Setting: When changing the NMT state of the whole network to state OPERATIONAL

Write to BFM #1000 to #1005 as follows according to the above-mentioned procedure.

Note

This procedure can only be performed when the FX3U-CAN is set up as the master.

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	SDO write success: H0003	Command SDO write: H0002
BFM #1001	Node number (The FX3U-CAN self): H0 (read back)	Node number (The FX3U-CAN self): H0
BFM #1002	Index (Request NMT): H1F82 (read back)	Index (Request NMT): H1F82
BFM #1003	Sub-index (all nodes): H80 (read back)	Sub-index (all nodes): H80
BFM #1004	Unused	Data length (1 byte): K1
BFM #1005		Command parameter data (NMT service remote node): H05
BFM #1006 to #1066		Unused

10.2.4 CIF Multi SDO write access

With the multi SDO write access command, up to 8 SDO write accesses can be made within one command. The maximum data length for each access is 8 bytes.
At first write the node number (0, 1-127), the Object Dictionary Index, the Sub-index, the data length (in byte) and the data to be sent to the BFMs.
Finally the command code for multi SDO write access "6" must be written to BFM #1000 in order to trigger the command execution.
If the access has been successful, BFM #1000 will display "7" and the following BFMs will contain the node number, index and sub index for verification purposes number.

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H0007: SDO write success H000F: Error (refer to Section 10.9) H00F7: Error (show Node number and Result data for details) HFFFF: CIF Busy	Command H0006: SDO Multi write
BFM #1001	Success: Node number (read back) Error: High Byte H0F, Low Byte Node number (read back)	Node number
BFM #1002	Index (read back)	Index
BFM #1003	Sub-index (read back)	Low byte: Sub index High byte: reserved
BFM #1004	Unused	Data length (in byte)
BFM #1005	Success: Unused Error: SDO access error code	Command parameter data (1 to 8 byte)
BFM #1006		
BFM #1007		
BFM #1008		
⋮	⋮	⋮
BFM #1057	Success: Node number (read back) Error: High Byte H0F, Low Byte Node number (read back)	Node number*1
BFM #1058	Index (read back)	Index
BFM #1059	Sub-index (read back)	Low byte: Sub index High byte: reserved
BFM #1060	Unused	Data length (in byte)
BFM #1061	Success: Unused Error: SDO access error code	Command parameter data (1 to 8 byte)
BFM #1062		
BFM #1063		
BFM #1064		
BFM #1065 to #1066	Unused	Unused

*1. If the final setting is located before BFM #1057, write HFFFF in the last BFM (Node number).

10.3 Set Heartbeat

Nodes can be easily set to Heartbeat Producer or Heartbeat Consumer status by writing values to Index H1016 and H1017 using the Command Interface (CIF). The parameters for Heartbeat are included in the information that can be written to the CAN bus.
The local FX3U-CAN can be specified by its actual node number or by using "0".
Note that the NMT Master startup process uses SDO's which can be result in an Error of the CIF command if the NMT Startup Master accesses the remote Node at the same time.

→ **For Object H1016 and H1017 (Heartbeat), refer to Subsection 5.6.9**

1. Heartbeat producing setting

Execution procedure: Heartbeat producing setting

1) Write target Node number and Producer heartbeat time value (in units of ms) to BFM #1001 to #1066.
   Write HFFFF to the node number following the last target node to complete Heartbeat producing settings.
2) Write the command code H7410 to BFM #1000.
   When the command code H7410 is written to BFM #1000, the command is executed.
3) When the executed command is successful, H7411 is written to BFM #1000.

→ **If H741F, H000F or HFFFF is read from BFM #1000, refer to Section 10.9**

<table>
<tr><th rowspan="2">BFM No.</th><th colspan="3">Description</th></tr>
<tr><th colspan="2">FROM (Read Access)</th><th>TO (Write Access)</th></tr>
<tr><td>BFM #1000</td><td colspan="2">H7411: Producing has been assigned
H741F: Parameter Error
HFFFF: CIF Busy
H000F: Error</td><td colspan="2">Command: H7410</td></tr>
<tr><td>BFM #1001</td><td rowspan="14" colspan="2">Diagnosis Data
H0000: No Error
All other values: The corresponding parameter caused an SDO error.</td><td rowspan="2">1st target node</td><td>Node number of producer</td></tr>
<tr><td>BFM #1002</td><td>Producer heartbeat time value (in units of ms)</td></tr>
<tr><td>BFM #1003</td><td rowspan="2">2nd target node</td><td>Node number of producer</td></tr>
<tr><td>BFM #1004</td><td>Producer heartbeat time value (in units of ms)</td></tr>
<tr><td>BFM #1005</td><td rowspan="2">3rd target node</td><td>Node number of producer</td></tr>
<tr><td>BFM #1006</td><td>Producer heartbeat time value (in units of ms)</td></tr>
<tr><td>⋮</td><td>⋮</td><td>⋮</td></tr>
<tr><td>BFM #1065</td><td rowspan="2">33rd target node</td><td>Node number of producer</td></tr>
<tr><td>BFM #1066</td><td>Producer heartbeat time value (in units of ms)</td></tr>
</table>

2. Heartbeat consuming setting

With this command, the Heartbeat consuming Index H1016 Sub index K1 to K32 will be set up at the node specified in BFM #1001.
To setup a Sub index higher than K32, use the SDO write command.

→ **For Heartbeat, refer to Subsection 5.6.9**
→ **For SDO Request, refer to Section 10.2**

Execution procedure: Heartbeat consuming setting

1) Write the Node number that has to be set up to BFM #1001.
   The local FX3U-CAN can be specified by its actual node number or by using "0".
2) Write target Node-ID to be Consumed and Consumer heartbeat time (in units of ms) to BFM #1002 to #1065.
   Write HFFFF to the Node-ID following the last consuming node to complete Heartbeat consuming settings.
3) Write the command code H7400 to BFM #1000.
   When the command code H7400 is written to BFM #1000, the command is executed.
4) When the executed command is successful, H7401 is written to BFM #1000.

→ If H740F, H000F or HFFFF is read from BFM #1000, refer to Section 10.9

BFM No.	Description		
	FROM (Read Access)	TO (Write Access)	
BFM #1000	H7401: Consuming has been assigned H740F: Parameter Error HFFFF: CIF Busy H000F: Error	Command: H7400	
BFM #1001	Diagnosis Data H0000: No Error All other values: The corresponding parameter caused an SDO error.	Node number which has to be set up	
BFM #1002		1st consumed node	Node-ID to be consumed
BFM #1003			Consumer heartbeat time (in units of ms)
BFM #1004		2nd consumed node	Node-ID to be consumed
BFM #1005			Consumer heartbeat time (in units of ms)
BFM #1006		3rd consumed node	Node-ID to be consumed
BFM #1007			Consumer heartbeat time (in units of ms)
⋮		⋮	⋮
BFM #1064		32nd consumed node	Node-ID to be consumed
BFM #1065			Consumer heartbeat time (in units of ms)
BFM #1066		Reserved	

10.4 Set Node Guarding / NMT Slave Assignment

Nodes can be easily set to Guarding-Master or Guarding-Slave status by writing values to Index H1F81 using the Command Interface (CIF). The parameters for guarding are included in the information that can be written to the CAN bus.
The module needs to be NMT Master to use these functions.

→ For Object H1F81, refer to Subsection 5.8.5

Note

- If the node number to be guarded exceeds the range K1 to K127, the corresponding BFM will display the value which caused the problem.
- The FX3U-CAN module may write a value of HFFFF to the "Slave configuration" parameter of a node that has a parameter configuration error.
- The FX3U-CAN module may write a value of HFFFF to the "Guard Time" parameter of a node that has a parameter configuration error.
- If the "Retry Factor" parameter exceeds 255, an error value will be displayed in the corresponding BFM.
- The FX3U-CAN module may write a value of HFFFF to the "Retry Factor" parameter of a node that has a parameter configuration error.
- If the node number, slave configuration, retry factor and guarding time is just copied to the corresponding result BFM, the remote node does not support Index H100C (guarding time)/H100D (retry factor). In this case, the remote node cannot detect a missing guarding request of the network master.

Execution procedure: Set Node guarding/NMT Slave Assignment

1) Write the Slave number, Slave Configuration, Guard Time and Retry of the target node to BFM #1001 to #1064. Set the Node-ID of the configured NMT Slave to Slave number. For the setting value of the Slave Configuration, Guard Time and Retry Factor, refer to the following section.
   Write HFFFF to the Slave number following the last target node to complete "Node guarding/NMT slave assignment" settings.

   → Refer to Subsection 5.8.7

2) Write the command code H8400 to BFM #1000.
   When the command code H8400 is written to BFM #1000, the command is executed.

3) When the executed command is successful, H8401 is written to BFM #1000.

   → If H84FF, H000F or HFFFF is read from BFM #1000, refer to Section 10.9

BFM No.	Description		
	FROM (Read Access)	TO (Write Access)	
BFM #1000	H8401: Slaves have been assigned H84FF: Parameter Error HFFFF: CIF Busy H000F: Error	Command: H8400	
BFM #1001	Diagnosis Data H0000: No Error All other values: The corresponding parameter caused an error.	1st target node	Slave Number to be Guarded
BFM #1002			Slave Configuration
BFM #1003			Guard Time
BFM #1004			Retry Factor
BFM #1005		2nd target node	Slave Number to be Guarded
BFM #1006			Slave Configuration
BFM #1007			Guard Time
BFM #1008			Retry Factor
⋮		⋮	⋮
BFM #1061		16th target node	Slave Number to be Guarded
BFM #1062			Slave Configuration
BFM #1063			Guard Time
BFM #1064			Retry Factor
BFM #1065		Unused	
BFM #1066		Unused	

10.5 Send an Emergency Message

This command can be used to send an emergency message from the PLC to the CANopen® network.

Execution procedure: Send an emergency message

1) Write the Emergency error code[*1], Error register and Manufacturer-specific error code[*2] that will be sent as the Emergency Message to BFM #1001 to #1004.
Unused Manufacturer-specific error code bytes have to be H00.
→ **For Error register, refer to following Subsection 5.6.2**

2) Write the command code H000A to BFM #1000.
When the command code H000A is written to BFM #1000, the command is executed.

3) When the executed command is successful, H000B is written to BFM #1000.
→ **If H000F or HFFFF is read from BFM #1000, refer to Section 10.9**

BFM No.	Description		
	FROM (Read Access)	TO (Write Access)	
		High Byte	Low Byte
BFM #1000	H000B: Command finished HFFFF: CIF Busy H000C: Communication Error H000F: Error	Command: H000A	
BFM #1001	H0000: No Error H0001: EMCY Inhibit time not elapsed H0002: Device is not in CANopen® state Operational or Pre-operational	Emergency error code[*1]	
BFM #1002	Unused	0th byte of Manufacturer-specific error code[*2]	Error register
BFM #1003		2nd byte of Manufacturer-specific error code[*2]	1st byte of Manufacturer-specific error code[*2]
BFM #1004		4th byte of Manufacturer-specific error code[*2]	3rd byte of Manufacturer-specific error code[*2]
BFM #1005 to #1066		Unused	

*1. Emergency error codes

In different CiA® Device/Application Profiles, more EMCY Error Codes are defined.

Error Code (hex)	Description
0000	Error reset or no error
0010	CiA® 417: CAN warning level
1000	Generic error
2000	Current – generic error
2100	Current, CANopen® device input side – generic
2200	Current inside the CANopen® device – generic
2300	Current, CANopen® device output side – generic
3000	Voltage – generic error
3100	Mains voltage – generic
3111	CiA® 417: Mains Over voltage
3121	CiA® 417: Mains Under voltage
3200	Voltage inside the CANopen® device – generic
3211	CiA® 417: Over voltage (device internal)
3221	CiA® 417: Under voltage (device internal)
3300	Output voltage – generic
4000	Temperature – generic error
4100	Ambient temperature – generic
4200	Device temperature – generic
5000	CANopen® device hardware – generic error
6000	CANopen® device software – generic error
6100	Internal software – generic
6200	User software – generic
6300	Data set – generic

Error Code (hex)	Description
7000	Additional modules – generic error
8000	Monitoring – generic error
8100	Communication – generic
8110	CAN overrun (objects lost)
8120	CAN in error passive mode
8130	Life guard error or heartbeat error
8140	Recovered from bus off
8150	CAN-ID collision
8200	Protocol error – generic
8210	PDO not processed due to length error
8220	PDO length exceeded
8230	DAM MPDO not processed, destination object not available
8240	Unexpected SYNC data length
8250	RPDO timeout
8F01 to 8F7F	Life guard error or heartbeat error caused by Node-ID 1 to Node-ID 127.
9000	External error – generic error
F000	Additional functions – generic error
FF00	Device specific – generic error*2
FF01	CiA® 417: Light barrier defect*2
FF02	CiA® 417: Finger protector defect*2
FF03	CiA® 417: Motion detection defect*2
FF04	CiA® 417: Application error, Manufacturer-specific error code: Byte 0 and 1 contain a Text error code, Byte 2 to 4 are reserved*2

*2. For EMCY Manufacturer specific error code, refer to the following section.

→ **Refer to Section 6.23**

10.6 Store Object Dictionary Settings

This command is an easy to use command for the store parameter command in the Object Dictionary Index H1010 Sub-index H01.
Note that the NMT Master startup process uses SDO's which can be result in an Error of the CIF SDO command if the NMT Startup Master accesses the remote Node at the same time.

→ **For the Object Dictionary Index H1010, refer to Subsection 5.6.11**

Execution procedure: Store object dictionary settings

1) Write the target node-ID for which Object Dictionary settings are to be stored, to BFM #1001 to #1066.
   When HFFFF is set as node-ID in BFM #1002 to #1066, the "Store Object Dictionary settings" is finished.
   The local FX3U-CAN can be specified by its actual node number or by using “0”.
2) Write the command code H6000 to BFM #1000.
   When the command code H6000 is written to BFM #1000, the command is executed.
3) When the Object Dictionary settings have been saved, H6001 is written to BFM #1000.

→ **If H600F, H000F or HFFFF is read from BFM #1000, refer to Section 10.9**

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H6001: Object Dictionary settings have been saved H600F: Parameter Error HFFFF: CIF Busy H000F: Error	Command: H6000
BFM #1001	Diagnosis Data H0000: No Error HFFFF: Parameter caused an error	1st target node-ID
⋮		⋮
BFM #1066		66th target node-ID

10.7 Restore Object Dictionary Default Settings

This command is an easy to use command for the load parameter command in the Object Dictionary Index H1011 Sub-index H01.

The CANopen® devices need to be reset after the command to make the change become effective.
Note that the NMT Master startup process uses SDO's which can be result in an Error of the CIF SDO command if the NMT Startup Master accesses the remote Node at the same time.

→ **For the Object Dictionary Index H1011, refer to Subsection 5.6.12**

Execution procedure: Restore object dictionary default settings

1) Write the target node-ID for which the object dictionary default settings are to be restored, to BFM #1001 to #1066.
   When HFFFF is set as node-ID in BFM #1002 to #1066, the "Restore object dictionary factory default settings" is finished.
   The local FX3U-CAN can be specified by its actual node number or by using "0".
2) Write the command code H6010 to BFM #1000.
   When the command code H6010 is written to BFM #1000, the command is executed.
3) When the Object Dictionary default settings have been restored, H6011 is written to BFM #1000.

→ **If H601F, H000F or HFFFF is read from BFM #1000, refer to Section 10.9**

4) To activate the default settings, the device has to reboot. Do not use the "Store Object Dictionary Settings" command between the "Restore Object Dictionary Default Settings" command and the Reset command.

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H6011: Object Dictionary default settings have been restored H601F: Parameter Error HFFFF: CIF Busy H000F: Error	Command: H6010
BFM #1001	Diagnosis Data H0000: No Error HFFFF: Parameter caused an error	1st target node-ID
⋮		⋮
BFM #1066		66th target node-ID

10.8 Display Current Parameter

This command can be used to display the parameter in BFM #1001 to #1066 of the last executed CIF command. If a command caused an error, this function allows the parameter which caused the error to be displayed and to make the necessary adjustments to the parameter set and sequence program.

Execution procedure: Display current parameter

1) Write the command code H0000 to BFM #1000.
2) When the parameter value of the last executed CIF command has been restored to BFM #1001 to #1066, H0000 is displayed to BFM #1000.*1

→ **If HFFFF is read from BFM #1000, refer to Section 10.9**

BFM No.	Description	
	FROM (Read Access)	TO (Write Access)
BFM #1000	H0000: Input buffer is displaying. HFFFF: CIF Busy	Command: H0000
BFM #1001 to #1066	Parameter values of the last executed CIF command	Unused

*1. Afterwards, when a new parameter is written to BFM #1000 to #1066, the parameters of the last executed CIF command will be displayed again except for the parameter that was just written.

10.9 Error Messages

10.9.1 Error messages

If an error occurs during the execution of a command, H000F is written to BFM #1000, and the Error Class and additional data are stored to BFM #1001 to BFM #1066.

BFM No.	Description
BFM #1000	Error: H000F
BFM #1001	Error Class
BFM #1002 to #1066	Additional data depending on an Error class

1. When using Unknown command

The written command to BFM #1000 is an unknown command.
Confirm the function mode setting and the executed command.

→ **For the function mode setting, refer to Section 6.5**
→ **For command interface that can be executed in each functional mode, refer to Chapter 10**

Note

This error will be also occur when a command in this function mode is not supported.

BFM No.	Description
BFM #1000	Error: H000F
BFM #1001	Error Class: H0064
BFM #1002 to #1066	Unused

2. When queue was not available

Access to the internal transmission queue was rejected. Possibly the bus load was too high.
This error may occur during Mode B mapping command execution for errors other than source or destination parameter errors. Please execute again after waiting a little.

BFM No.	Description
BFM #1000	Error: H000F
BFM #1001	Error Class: H8FFF
BFM #1002 to #1066	Unused

3. Command or parameter change while CIF was busy

During FX3U-CAN Command interface execution, HFFFF is written in the read access area of BFM #1000.
During Command interface execution, a new command cannot be executed.
If accessing BFM #1000 to BFM #1066 during the CIF execution, an error may occur, and H000F will be shown in the BFM #1000.

→ **For the executing Command interface discontinuance procedure, refer to Subsection 10.9.2**

BFM No.	Description
BFM #1000	Error: H000F
BFM #1001	Error Class: HFFFF
BFM #1002 to #1066	Unused

4. Clear/Reset the "CIF was busy" Error

To Reset the CIF after a “Command or Parameter Change while CIF was busy” Error, HFFFF must be written using the TO command to BFM #1000. The CIF is available again if the BFM #1000 displays H0000.

5. SDO error

Node-ID of an error and SDO access abort code are stored in BFM #1002 to #1004.

BFM No.	Description
BFM #1000	Error: H000F
BFM #1001	Error Class: H0003
BFM #1002	Node-ID
BFM #1003	Low Word of SDO access abort code*1
BFM #1004	High Word of SDO access abort code*1
BFM #1005 to #1066	Unused

*1. SDO access abort codes

In different CiA® Device/Application Profiles, more SDO access abort codes are defined.

→ **For SDO access abort codes that are not in the following table, refer to the manual of the device which sent the message**

SDO access abort code (hex)		Description
High Word	Low Word	
0503	0000	Toggle bit not alternated.
0504	0000	SDO protocol timed out. (FX3U-CAN: 500ms)
0504	0001	Client/server command specifier not valid or unknown.
0504	0002	Invalid block size (block mode only).
0504	0003	Invalid sequence number (block mode only).
0504	0004	CRC error (block mode only).
0504	0005	Out of memory.
0601	0000	Unsupported access to an object.
0601	0001	Attempt to read a write only object.
0601	0002	Attempt to write a read only object.
0602	0000	Object does not exist in the object dictionary.
0604	0041	Object cannot be mapped to the PDO.
0604	0042	The number and length of the objects to be mapped would exceed PDO length.
0604	0043	General parameter incompatibility reason.
0604	0047	General internal incompatibility in the device.
0606	0000	Access failed due to a hardware error.
0607	0010	Data type does not match, length of service parameter does not match
0607	0012	Data type does not match, length of service parameter too high
0607	0013	Data type does not match, length of service parameter too low
0609	0011	Sub-index does not exist.
0609	0030	Invalid value for parameter (download only).
0609	0031	Value of parameter written too high (download only).
0609	0032	Value of parameter written too low (download only).
0609	0036	Maximum value is less than minimum value.
060A	0023	Resource not available: SDO connection
0800	0000	General error
0800	0020	Data cannot be transferred or stored to the application.
0800	0021	Data cannot be transferred or stored to the application because of local control.
0800	0022	Data cannot be transferred or stored to the application because of the present device state.
0800	0023	Object dictionary dynamic generation fails or no object dictionary is present
0800	0024	No data available
5000	0000	Time out or impossible to allocate identifier for SDO transmission or Protocol mismatch
6060	0000	Buffer too small for received SDO data (this error will occur during initialization of the transmission)

6. Bus off

The FX3U-CAN is in Bus off and cannot send CAN messages.

BFM No.	Description
BFM #1000	Error: H000F
BFM #1001	Error Class: HB0FF
BFM #1002 to #1066	Unused

7. Device in wrong state

The state of the FX3U-CAN cannot execute the requested command interface.
Confirm the function mode setting and the state of FX3U-CAN.

→ **For the function mode setting, refer to Section 6.5**
→ **For command interface which can be executed in each functional mode, refer to Chapter 10**
→ **For the FX3U-CAN status, refer to Section 6.8**

BFM No.	Description
BFM #1000	Error: H000F
BFM #1001	Error Class: H0F0F
BFM #1002 to #1066	Unused

10.9.2 CIF busy message

During FX3U-CAN Command interface execution, HFFFF is written in the read access area of BFM #1000.
During Command interface execution, a new command cannot be executed.
If a new command will be executed or a parameter of the running command will be changed, discontinue the executing command by using the following method.
If BFM #1000 to BFM #1066 are written to during command interface execution, an error may occur, and H000F will be written to BFM #1000.

→ **For error message, refer to Subsection 10.9.1**

Executing Command interface discontinuance procedure

1) Write HFFFF to BFM #1000 to discontinue the processing command.
2) If the executed command is reset, H0000 is displayed in BFM #1000.
3) The CIF is available again when BFM #1000 is H0000.

11. PLC RUN/STOP

STARTUP AND MAINTENANCE PRECAUTIONS **⚠WARNING**

- Before modifying or disrupting the program in operation or running the PLC, carefully read through this manual and the associated manuals and ensure the safety of the operation.
  An operation error may damage the machinery or cause accidents.

FX3U-CAN operates as follows when the STOP/RUN state of the PLC changes.

1. CANopen® NMT Slave

- RUN→STOP
  FX3U-CAN changes into the CANopen® state as set in the Error behaviour Object. In addition an EMCY is sent.
  → **For Error behaviour, refer to Section 5.7**
  → **For EMCY, refer to Subsection 5.6.13**
- STOP→RUN
  FX3U-CAN stays in the current CANopen® state.

2. CANopen® NMT Master without Flying Master function

- RUN→STOP
  FX3U-CAN changes into the CANopen® state as set in the Error behaviour Object. The NMT Master Entity, the Heartbeat producing and the Node Guarding will be stopped. NMT Slaves with Heartbeat consuming or Life Guarding have the possibility to respond to the loss of the NMT Master. In addition an EMCY is sent.
  → **For Error behaviour, refer to Section 5.7**
  → **For EMCY, refer to Subsection 5.6.13**
- STOP→RUN
  The Module enables Heartbeat and NMT Master services again, and starts the NMT Master startup service.
  → **For NMT Master startup, refer to Subsection 5.8.5**

3. CANopen® NMT Master with Flying Master function

- RUN→STOP
  FX3U-CAN changes into the CANopen® state as set in the Error behaviour Object. The NMT Master Entity, the Heartbeat producing and the Node Guarding will be stopped. Other NMT Flying Masters will start a Flying Master negotiation if the Module was the active NMT Master. In addition an EMCY is sent.
  → **For Error behaviour, refer to Section 5.7**
  → **For EMCY, refer to Subsection 5.6.13**
- STOP→RUN
  The Module enables Heartbeat and NMT Master services again, and starts a Flying Master negotiation.
  → **For Flying Master, refer to Subsection 5.8.11**

4. Layer 2

- RUN→STOP
  FX3U-CAN sends the PLC RUN>STOP message (if configured) and changes into Offline state after this.
- STOP→RUN
  FX3U-CAN stays in the current state.

12. Communication Settings Procedure

STARTUP AND MAINTENANCE PRECAUTIONS **⚠WARNING**

- Do not touch any terminal while the PLC's power is on.
  Doing so may cause electric shock or malfunctions.
- Before cleaning or retightening terminals, cut off all phases of the power supply externally.
  Failure to do so may cause electric shock.
- Before modifying or disrupting the program in operation or running the PLC, carefully read through this manual and the associated manuals and ensure the safety of the operation.
  An operation error may damage the machinery or cause accidents.

STARTUP AND MAINTENANCE PRECAUTIONS **⚠CAUTION**

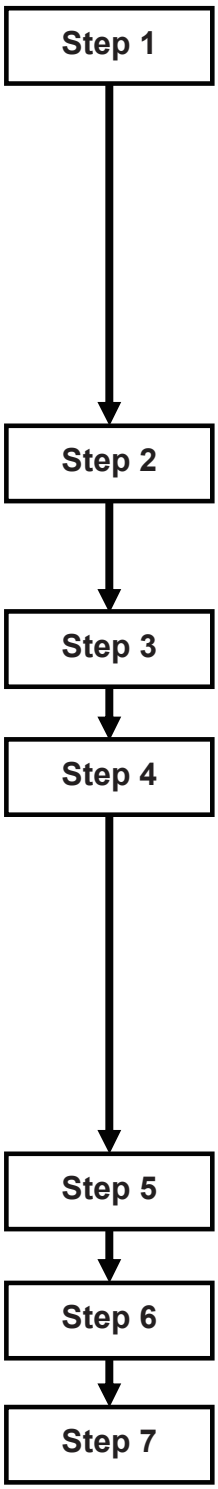
- Do not disassemble or modify the PLC.
  Doing so may cause fire, equipment failures, or malfunctions.
  For repair, contact your local Mitsubishi Electric representative.
- Turn off the power to the PLC before connecting or disconnecting any extension cable.
  Failure to do so may cause equipment failures or malfunctions.
- Do not drop the product or exert strong impact to it.
  Doing so may cause damage.
- Turn off the power to the PLC before attaching or detaching the following devices.
  Failure to do so may cause equipment failures or malfunctions.
  - Peripheral devices, display module, expansion boards, and special adapters
  - Input/output extension units/blocks, FX Series terminal blocks and special function units/blocks
  - Battery and memory cassette

12.1 CANopen® 405 Mode

When using CANopen® 405 mode, the outline of the communication setting procedure is as follows.

To set the Object Dictionary and the TPDO/RPDO mapping, the use of CANopen® configuration software is recommended.

→ For further information on CANopen® configuration software, refer to the manual of the software to be used
→ For further information on the Object Dictionary, refer to Chapter 5
→ For further information on BFMs, refer to Chapter 6
→ For further information on data transfer location and PDO mapping, refer to Chapter 7
→ For further information on the CIF, refer to Chapter 10
→ For example program, refer to Chapter 13



Step 1

1) Set the following.
→ Refer to Chapter 6
- Function mode (BFM #21)

2) Store setting to Flash ROM. (BFM #22)
→ Refer to Chapter 6

3) FX3U-CAN restart

4) Set the following.
- Baud rate (BFM #24)
- Watchdog timer (BFM #26)
- Node address (BFM #27)

5) Store setting to Flash ROM. (BFM #22)
→ Refer to Chapter 6

6) FX3U-CAN restart

Step 2

1) Set the following required function.
→ Refer to Section 5.8
- NMT master/Flying Master

2) Save the Object Dictionary.
→ Refer to Subsection 5.6.11 and Section 10.6

Step 3

FX3U-CAN restart
→ For Module restart, refer to Section 6.8

Step 4

1) Set the following required functions.
→ Refer to Section 5.6, Section 5.8 and Section 6.18
- Heartbeat / the Node Guarding (either settings are possible.)
- TIME
- Layer Setting Services (LSS)
- NMT Master:
  - Set up NMT Slave assignment H1F81
  - Set up NMT Slave identification data H1F84 to H1F88
  - Set up Boot time

Note:
When using FX3U-CAN as the Producer of the TIME message, parameters have to be set in BFM #50 to #59 in the program used for normal operation.

2) Set the TPDO/RPDO mapping.
→ Refer to Chapter 7

Step 5

Save the Object Dictionary.
→ Refer to Subsection 5.6.11 and Section 10.6

Step 6

Shift the NMT state to OPERATIONAL.
When FX3U-CAN is NMT Master, shift the NMT state of NMT slave into OPERATIONAL.
→ Refer to Section 5.8

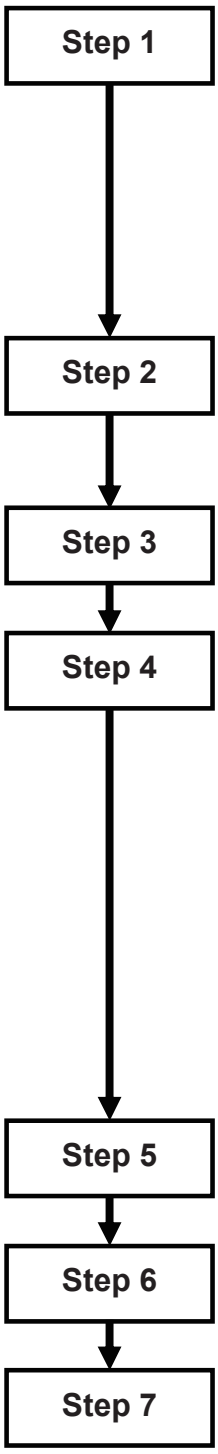
Step 7

The TPDO/RPDO data and Emergency Message, etc. can be exchanged to CAN bus.
→ For example program, refer to Chapter 13

12.2 CANopen® 417 Mode

When using CANopen® 417 mode, the outline of the communication setting procedure is as follows.
To set the Object Dictionary, the use of CANopen® configuration software is recommended.

→ For further information on CANopen® configuration software, refer to the manual of the software to be used
→ For further information on the Object Dictionary, refer to Chapter 5
→ For further information on BFMs, refer to Chapter 6
→ For further information on data transfer location, refer to Chapter 8
→ For further information on the CIF, refer to Chapter 10
→ For example program, refer to Chapter 13



Step 1

1) Set the following.
- Function mode (BFM #21)

→ Refer to Chapter 6

2) Store setting to Flash ROM. (BFM #22)

→ Refer to Chapter 6

3) FX3U-CAN restart

4) Set the following.
- Baud rate (BFM #24)
- Watchdog timer (BFM #26)
- Node address (BFM #27)

Step 2

1) Set the following required function.

→ Refer to Section 5.8

- NMT master/Flying Master

2) Save the Object Dictionary.

→ Refer to Subsection 5.6.11 and Section 10.6

Step 3

FX3U-CAN restart

→ For Module restart, refer to Section 6.8

Step 4

1) Set the following required functions.

→ Refer to Section 5.6, Section 5.8 and Section 6.18

- Heartbeat / the Node Guarding (either settings are possible.)
- TIME
- Layer Setting Services (LSS)
- NMT Master:
  - Set up NMT Slave assignment H1F81
  - Set up NMT Slave identification data H1F84 to H1F88
  - Set up Boot time

Note:
When using FX3U-CAN as the Producer of the TIME message, parameters have to be set in BFM #50 to #59 in the program for normal operation.

2) Set the Lift number.

→Refer to Section 5.10 and Section 8.2

Note:
When setting Lift number in BFM #3000, set BFM #20 bit 0 to ON after setting it.

Step 5

Save the Object Dictionary.

→ Refer to Subsection 5.6.11 and Section 10.6

Step 6

Shift the NMT state to OPERATIONAL.
When FX3U-CAN is NMT Master, shift the NMT state of NMT slave into OPERATIONAL.

→ Refer to Section 5.8

Step 7

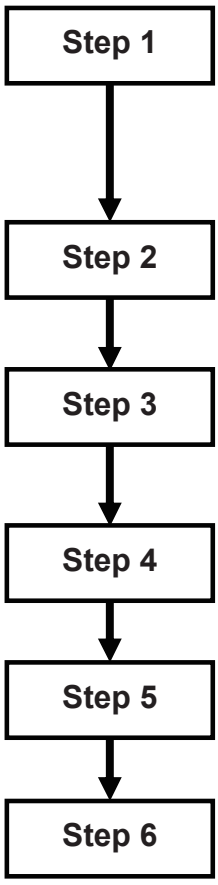
The Lift application data and Emergency Message, etc. can be exchanged to CAN bus.

→ For data transfer location, refer to Chapter 8
→ For example program, refer to Chapter 13

12.3 11 bit / 29 bit CAN-ID Layer 2 Mode

When using the 11 bit / 29 bit CAN-ID Layer 2 Mode, the outline of the communication setting procedure is as follows.

→ For further information on BFMs, refer to Chapter 6
→ For further information on data transfer location, refer to Chapter 9
→ For the CIF available in these modes, refer to Chapter 9
→ For example program, refer to Chapter 13



1) Set the following.

→ Refer to Chapter 6

- Function mode (BFM #21)
- Baud rate (BFM #24)
- Watchdog timer (BFM #26)

2) Store setting to Flash ROM. (BFM #22)

→ Refer to Chapter 6

FX3U-CAN restart

→ For Module restart, refer to Section 6.8

Set the configuration of transmitted and received data.

→ Refer to Chapter 9

Store setting to Flash ROM. (BFM #22)

→ Refer to Chapter 6

Shift FX3U-CAN to Layer 2 online mode.

→ Refer to Section 6.8

The CAN messages can be exchanged to CAN bus.

→ For example program, refer to Chapter 13

13. Program Example

STARTUP AND MAINTENANCE PRECAUTIONS **⚠WARNING**

- Do not touch any terminal while the PLC's power is on.
  Doing so may cause electric shock or malfunctions.
- Before cleaning or retightening terminals, cut off all phases of the power supply externally.
  Failure to do so may cause electric shock.
- Before modifying or disrupting the program in operation or running the PLC, carefully read through this manual and the associated manuals and ensure the safety of the operation.
  An operation error may damage the machinery or cause accidents.

STARTUP AND MAINTENANCE PRECAUTIONS **⚠CAUTION**

- Do not disassemble or modify the PLC.
  Doing so may cause fire, equipment failures, or malfunctions.
  For repair, contact your local Mitsubishi Electric representative.
- Turn off the power to the PLC before connecting or disconnecting any extension cable.
  Failure to do so may cause equipment failures or malfunctions.
- Do not drop the product or exert strong impact to it.
  Doing so may cause damage.
- Turn off the power to the PLC before attaching or detaching the following devices.
  Failure to do so may cause equipment failures or malfunctions.
  - Peripheral devices, display module, expansion boards, and special adapters
  - Input/output extension units/blocks, FX Series terminal blocks and special function units/blocks
  - Battery and memory cassette

The Programs shown below are examples of how to set local parameters, set up a CANopen® network, and exchange data over the CANopen® bus with the FX3U-CAN.
Large networks can be configured more quickly and easily by using a CANopen® configuration tool instead.

Note

These program examples together with the Function blocks can be downloaded from http://eu3a.mitsubishielectric.com/fa/en/ in the MyMitsubishi section (free registration necessary).

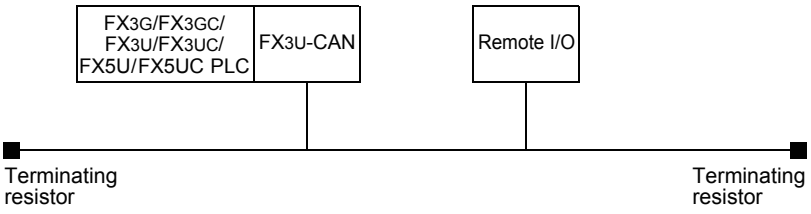
Note

The sample ladder program use labels.

→ **For label setting operation on GX Works2, refer to GX Works2 Version 1 Operating Manual (Simple Project)**

13.1 System Configuration

The sample Program sets up the initial BFM and Object dictionary settings and starts PDO Communication.



13.2 Local Label Setting

No.	Class	Label Name	Data Type
1	VAR	CANID	Word[Unsigned]/Bit String[16-bit]

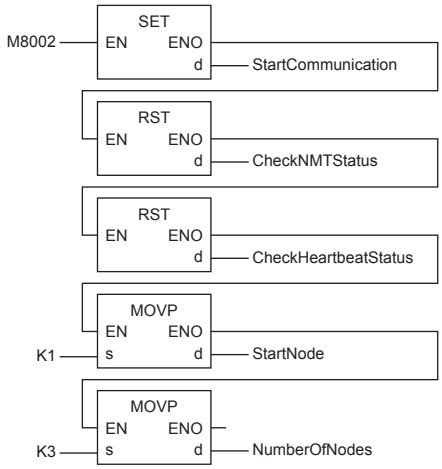
13.3 Program

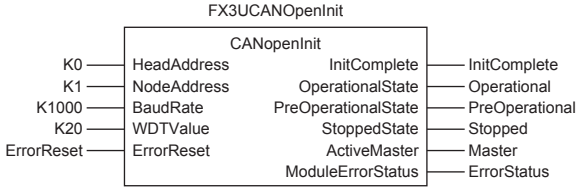
1

On the initial scan, start the communication and set the NMT status settings



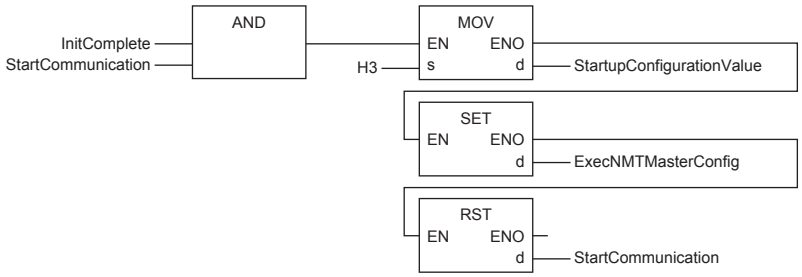
2

Setup the initial settings for the FX3U-CAN module



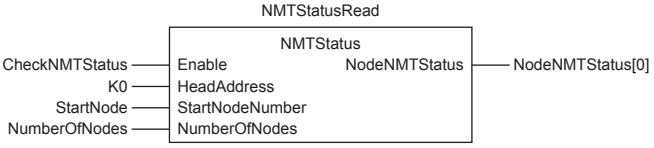
3

If the init procedure is completed start the NMT master setup procedure



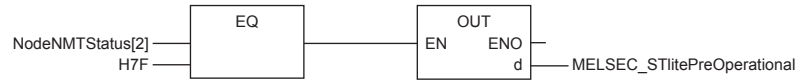
4

Check the NMT status of specified nodes



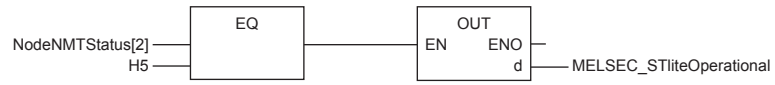
5

Check if the MELSEC_STlite CANopen node is in pre-operational mode



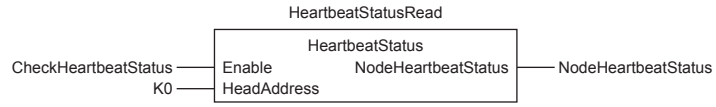
6

Check if the MELSEC_STlite CANopen node is in operational mode



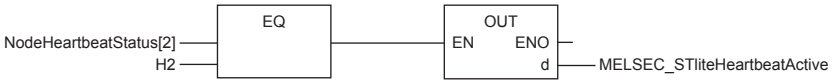
7

Check the heartbeat status of all nodes



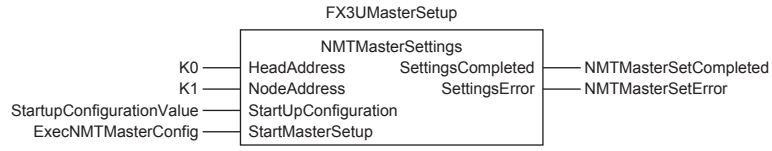
8

Check if the MELSEC_STlite slave node has an active Heartbeat signal



9

Configure the start up behaviour of the CANopen master device

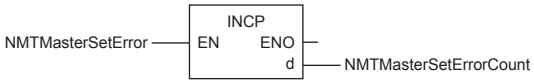


10

If a NMT Master setup command execution is completed, reset its execution signal

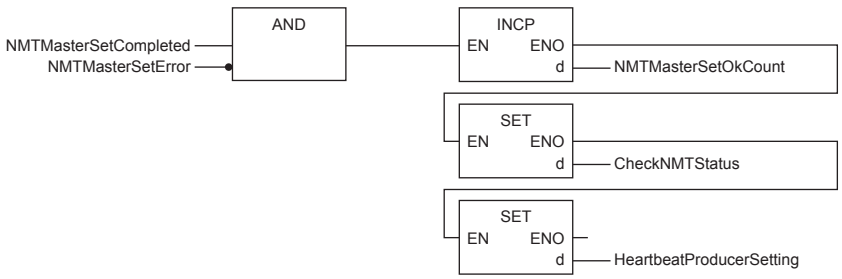
11

If a NMT Master setup command execution error occurs, increase the command error counter



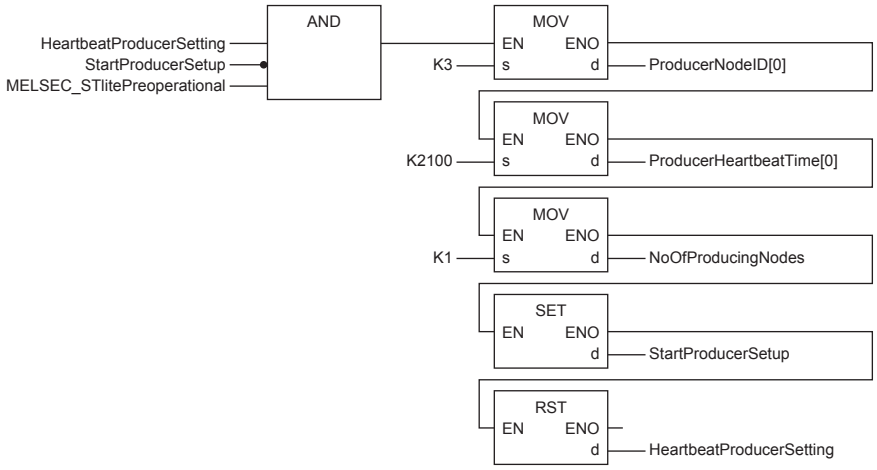
12

If a NMT Master setup command execution is completed, increase the command complete counter and move to the next command



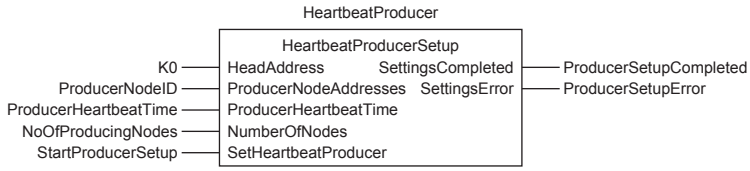
13

Initialize the Heartbeat producer setup command data



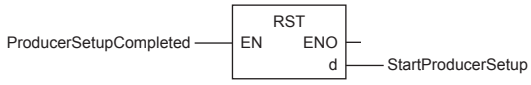
14

Issue an Heartbeat producing setup command



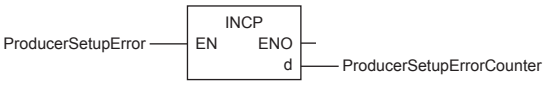
15

If a command execution is completed, reset its execution signal



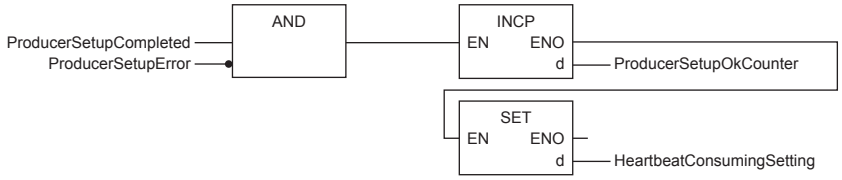
16

If a command execution error occurs, increase the command error counter



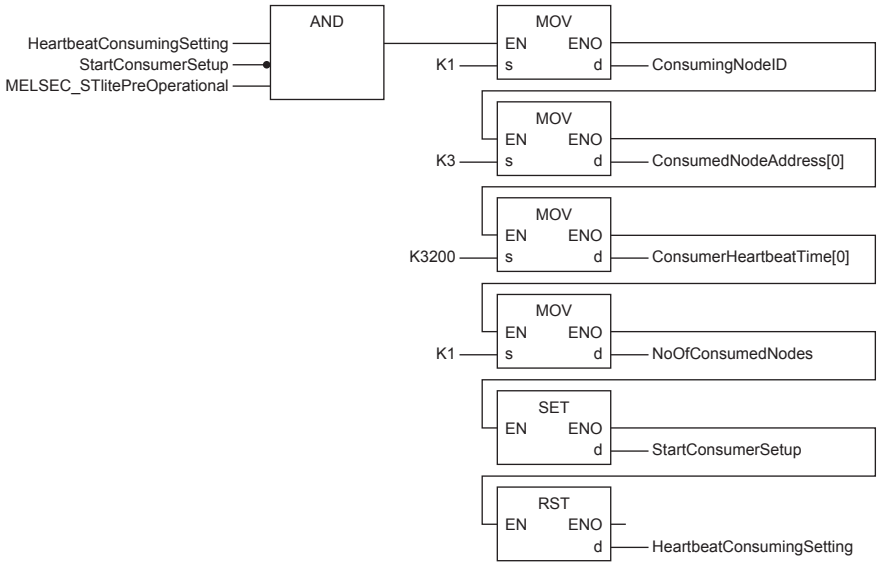
17

If a command execution is completed, increase the command complete counter and move to the next command



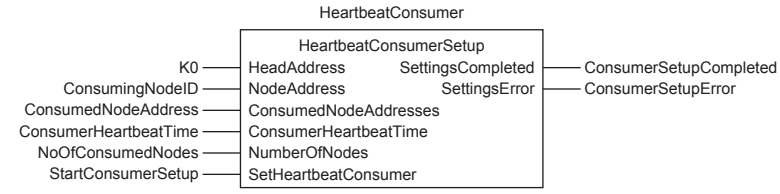
18

Issue an Heartbeat consuming setup command



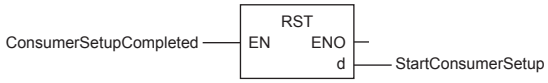
19

Issue an Heartbeat consuming setup command



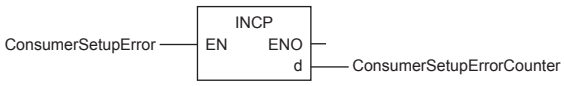
20

If a Heartbeat consuming setup command execution is completed, reset its execution signal



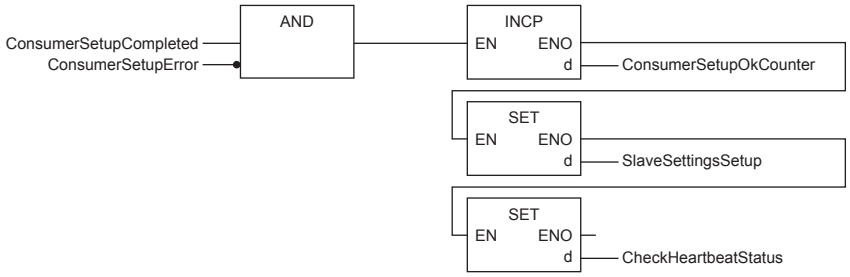
21

If a Heartbeat consuming setup command execution error occurs, increase the command error counter



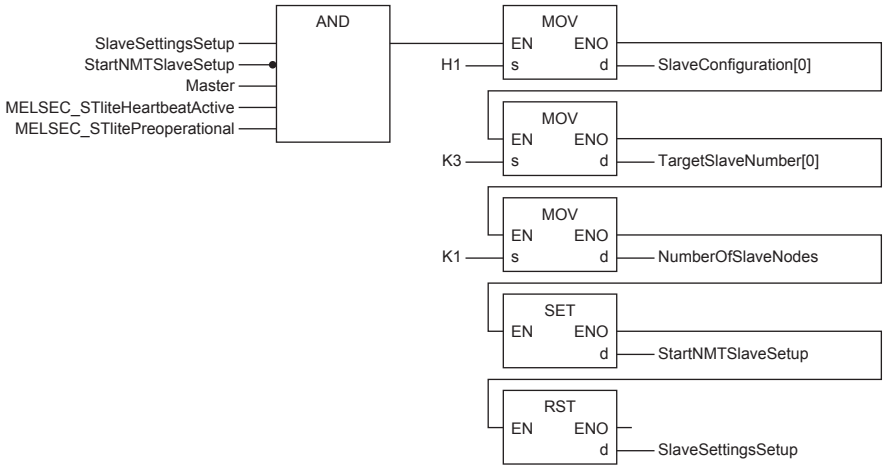
22

If a Heartbeat consuming setup command execution is completed, increase the command complete counter and move to the next command



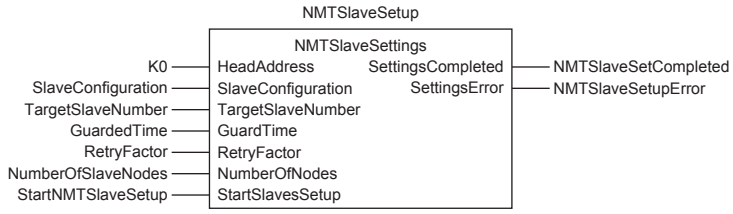
23

Initialize the set NMT Slave behaviour command data



24

Configure the NMT behaviour of CANopen slave devices

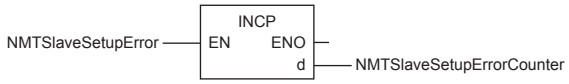


25

If a NMT slave setup command execution is completed reset status signal and move to the next one

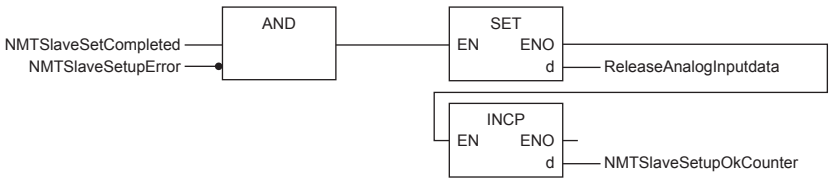
26

If a NMT slave setup command execution error occurs, increase the command error counter



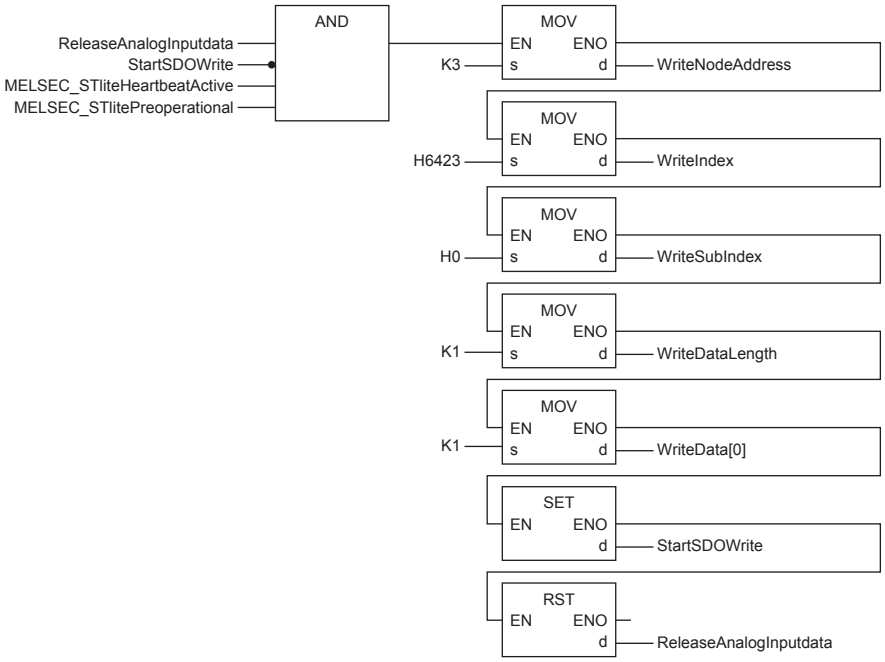
27

If a NMT slave setup command execution is completed, increase the command complete counter



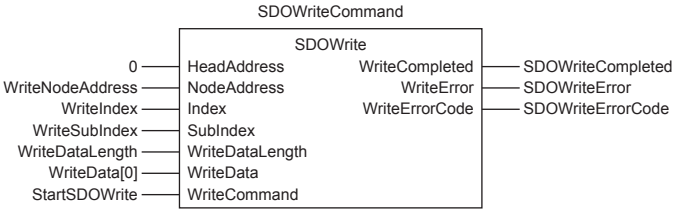
28

Issue an SDO write command to activate the transmission of analog input data from the MELSEC_STlite node



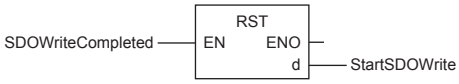
29

Execute an SDO write command to the index 6423, sub-index 0 of node address 3



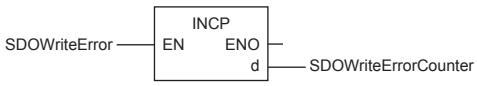
30

If a SDO write command execution is completed, reset its execution signal



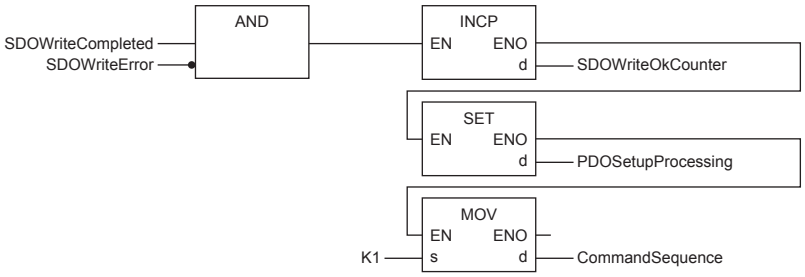
31

If a SDO write command execution error occurs, increase the command error counter



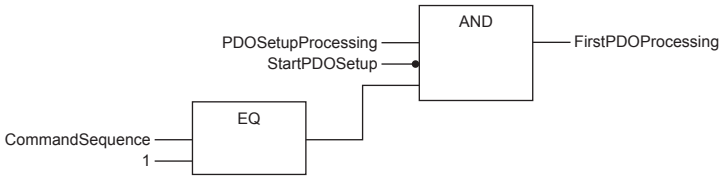
32

If a SDO write command execution is completed, increase the command complete counter and move to the next command



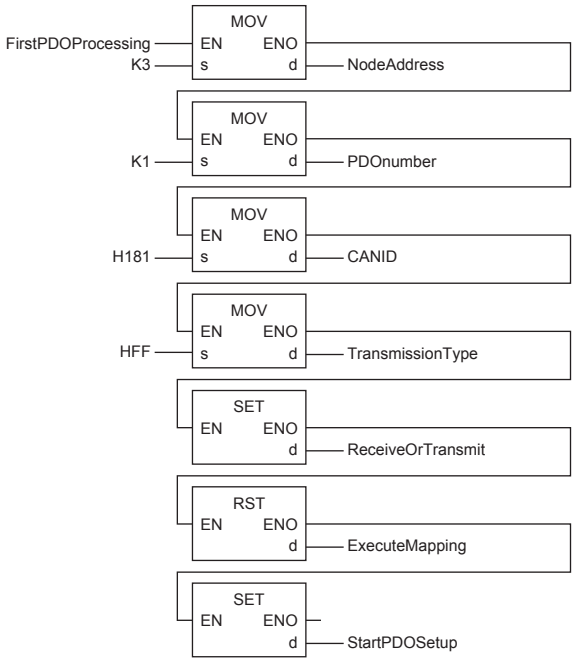
33

Check if the first PDO setup command needs to be executed



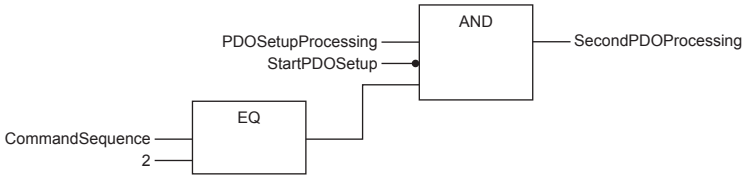
34

Set the communication parameters for the selected PDO



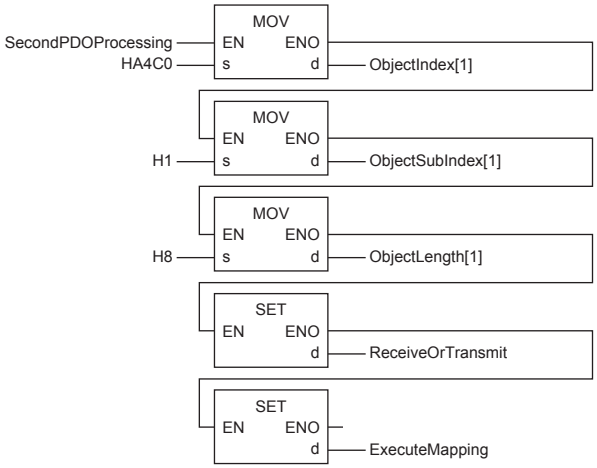
35

Check if the second PDO setup command needs to be executed



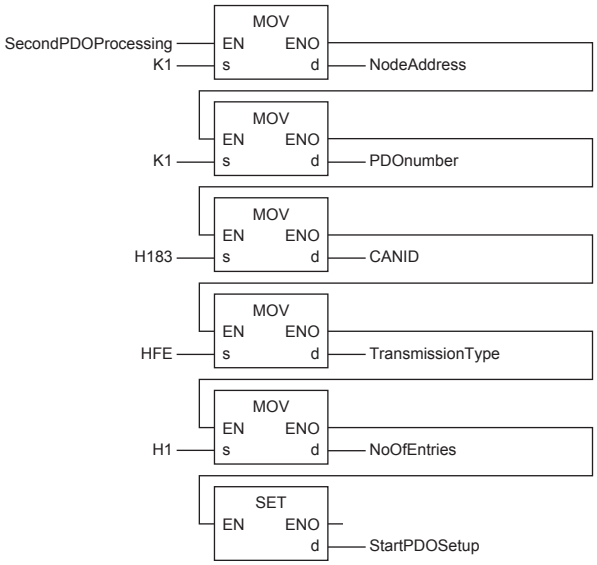
36

Set the data for the mapped object in the selected PDO



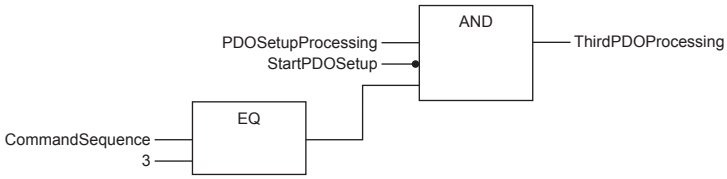
37

Set the communication parameters for the selected PDO



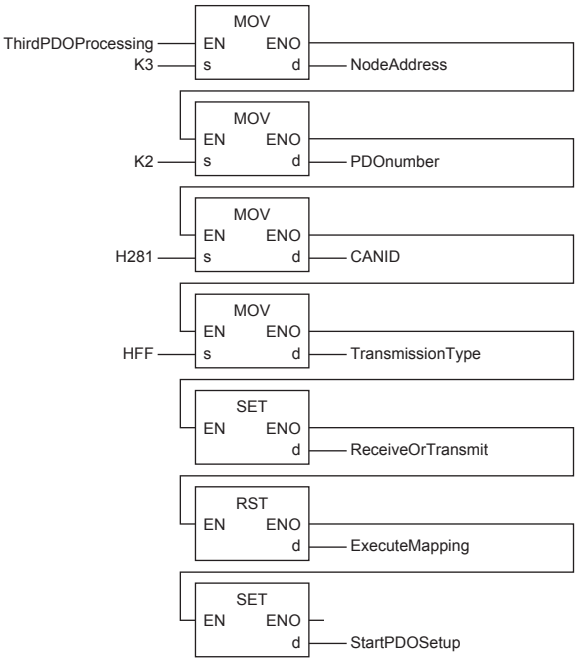
38

Check if the third PDO setup command needs to be executed



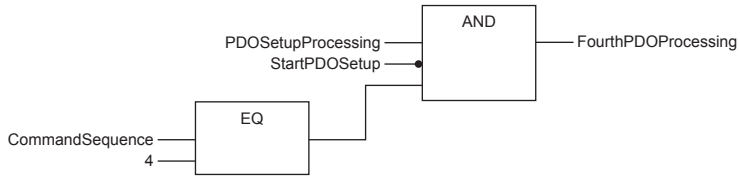
39

Set the communication parameters for the selected PDO



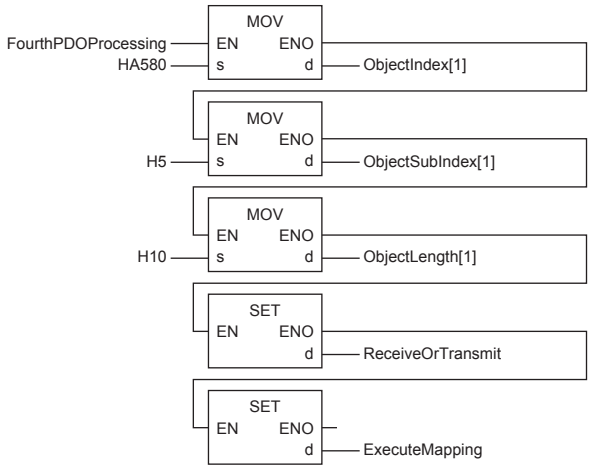
40

Check if the fourth PDO setup command needs to be executed



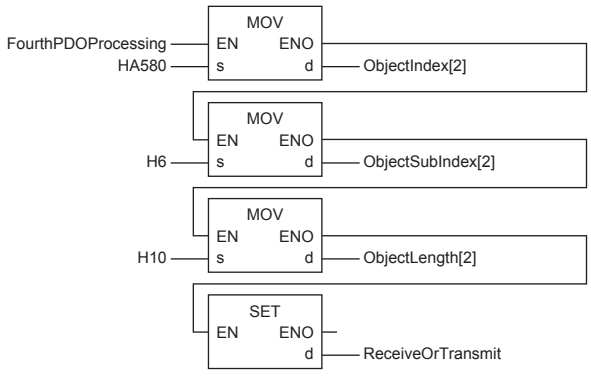
41

First, initialize the data for the first mapped object of the fourth PDO setup command



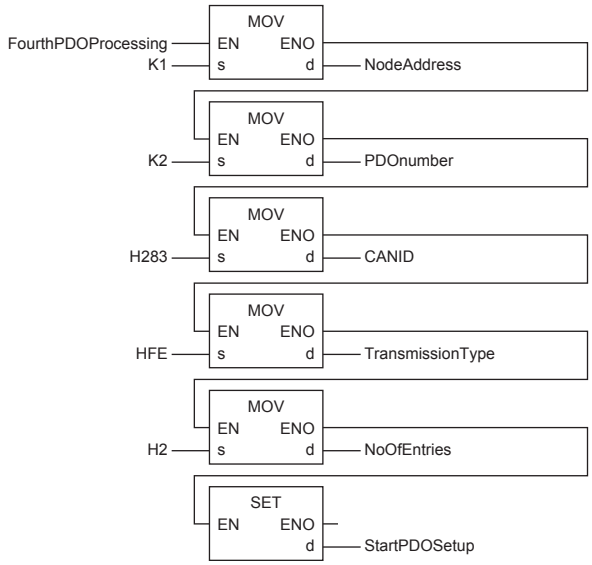
42

Initialize the data for the second mapped object of the fourth PDO setup command



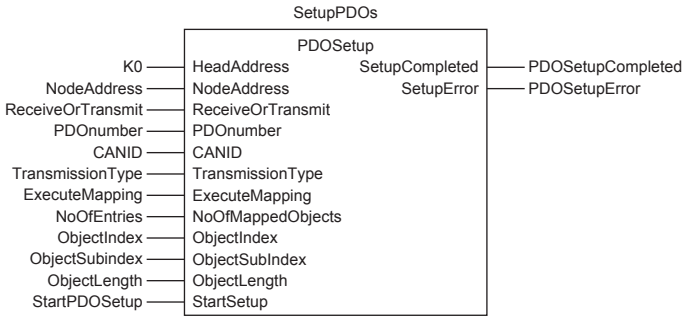
43

Then, initialize the communication parameters data for the fourth PDO setup command:



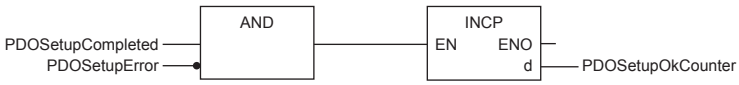
44

Change the PDO communication and/or mapping parameters of a specified PDO



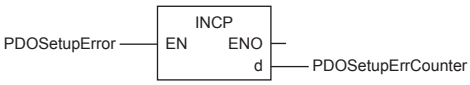
45

If a PDO setup command execution is completed, increase the command complete counter



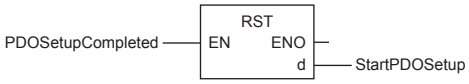
46

If a PDO setup command execution error occurs, increase the command error counter



47

If a PDO setup command execution is completed reset status signal

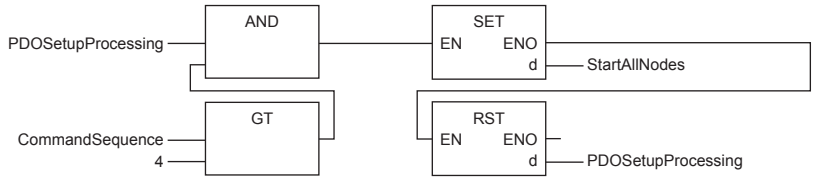


48

If a PDO setup command was executed, move to the next one

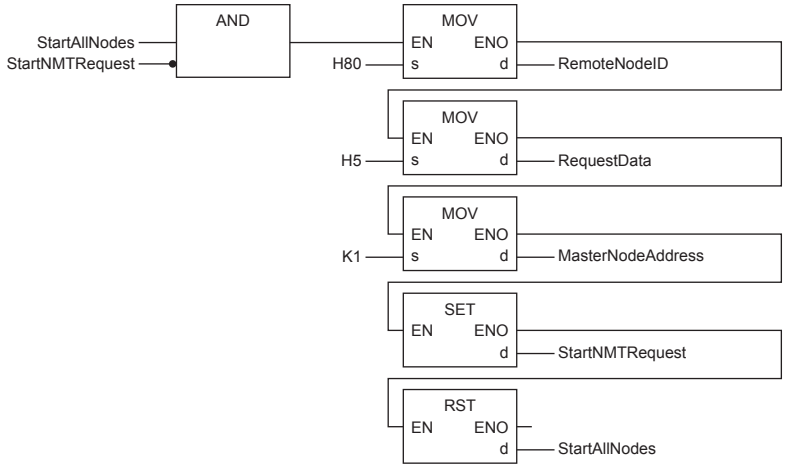
49

When ALL the PDO setup commands are normaly completed, start the next command



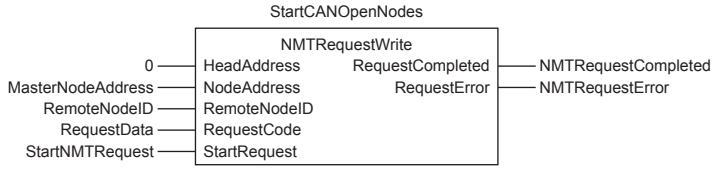
50

When the previous command is completed, issue a Start all nodes command from the CANOpen master



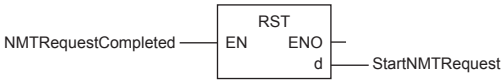
51

Use the NMT request write command to start all remote nodes



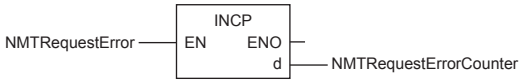
52

If a NMT write request execution is completed, reset its execution signal



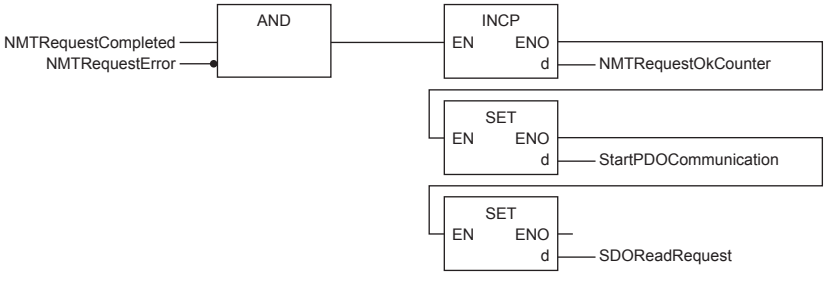
53

If a NMT write request execution error occurs, increase the command error counter



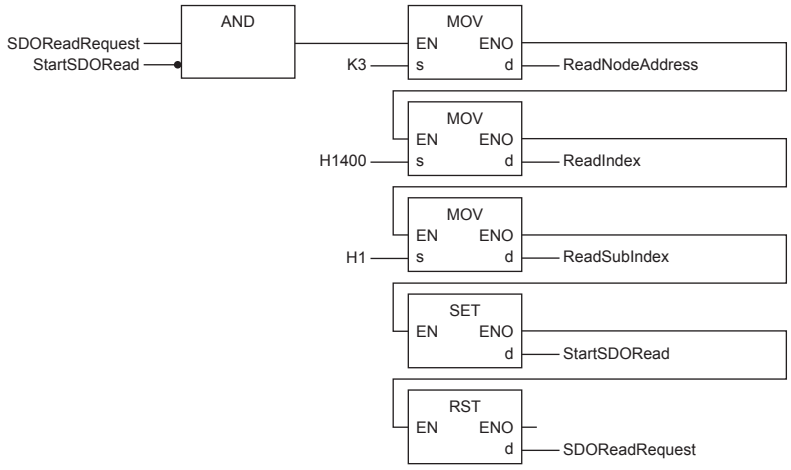
54

If a NMT write request execution is completed, increase the command complete counter and move to the next command



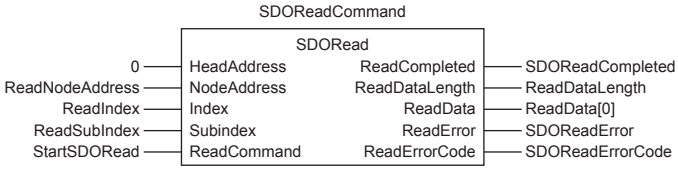
55

When the previous command is completed, issue a SDO Read command



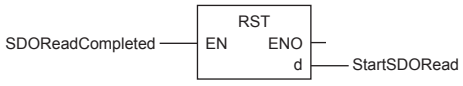
56

Use the SDO read command to read index 1400, sub-index 1 from node address 3 (it reads the CAN-ID of the first RPDO of the MELSEC_STlite node)



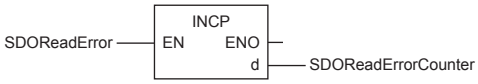
57

If a SDO Read command is completed, reset its execution signal



58

If a SDO Read command error occurs, increase the command error counter

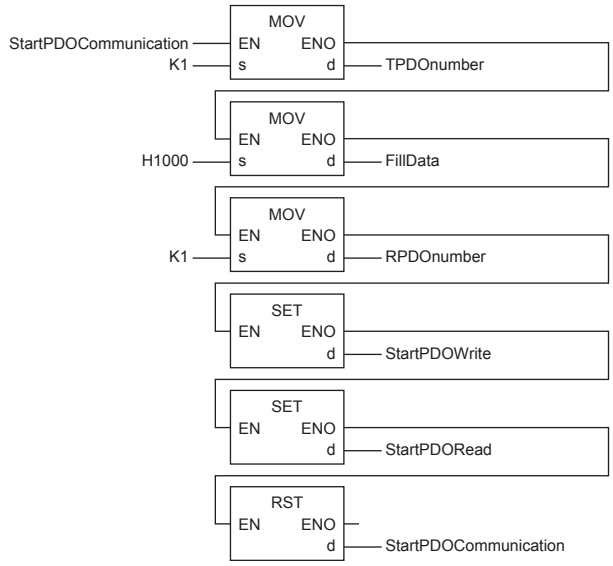


59

If a SDO Read command is completed, increase the command complete counter

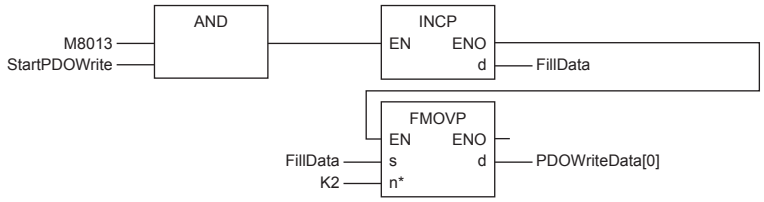
60

When the previous is completed, start the PDO communication and start an SDO Read request



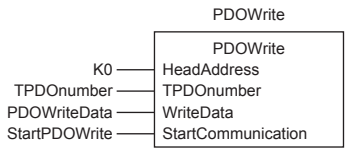
61

On the rising edge of the one second clock, increase the PDO write data



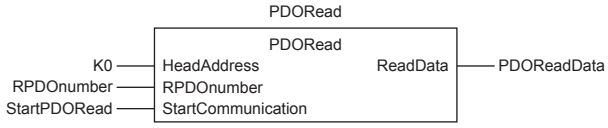
62

Write the PDO data



63

Read the PDO data



14. Diagnostics

STARTUP AND MAINTENANCE PRECAUTIONS ⚠ **WARNING**

- Do not touch any terminal while the PLC's power is on.
  Doing so may cause electric shock or malfunctions.
- Before cleaning or retightening terminals, cut off all phases of the power supply externally.
  Failure to do so may cause electric shock.
- Before modifying or disrupting the program in operation or running the PLC, carefully read through this manual and the associated manuals and ensure the safety of the operation.
  An operation error may damage the machinery or cause accidents.

STARTUP AND MAINTENANCE PRECAUTIONS ⚠ **CAUTION**

- Do not disassemble or modify the PLC.
  Doing so may cause fire, equipment failures, or malfunctions.
  For repair, contact your local Mitsubishi Electric representative.
- Turn off the power to the PLC before connecting or disconnecting any extension cable.
  Failure to do so may cause equipment failures or malfunctions.
- Do not drop the product or exert strong impact to it.
  Doing so may cause damage.
- Turn off the power to the PLC before attaching or detaching the following devices.
  Failure to do so may cause equipment failures or malfunctions.
  - Peripheral devices, display module, expansion boards, and special adapters
  - Input/output extension units/blocks, FX Series terminal blocks and special function units/blocks
  - Battery and memory cassette

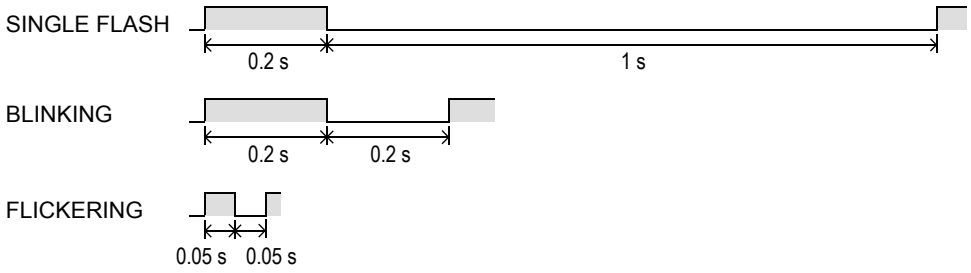
14.1 Preliminary Checks

Check the RUN, FROM/TO, Tx/Rx, ERROR and POWER LED status.

1. RUN LED

LED State	Description
OFF	FX3U-CAN is in Layer 2 offline mode.
SINGLE FLASH*1	FX3U-CAN is in CANopen® STOPPED state. Periodically turns ON for 100 ms, and OFF for 1 s.
BLINKING*1	FX3U-CAN is in CANopen® PRE-OPERATIONAL state. Turns ON/OFF in 200 ms intervals.
FLICKERING*1	LSS Services in progress Turns ON/OFF in 50 ms intervals.
ON	• CANopen® mode: CANopen® OPERATIONAL state • Layer 2 mode: Layer 2 online mode

*1. RUN LED has three kinds of flicker states: single flash, blinking, and flickering. This LED flickers as follows.



2. FROM/TO LED

LED State	Description
OFF	PLC is not accessing BFMs in FX3U-CAN using FROM/TO instructions or other instructions which specify buffer memory values directly.
ON	PLC is accessing BFMs in FX3U-CAN using FROM/TO instructions or other instructions which specify buffer memory values directly.

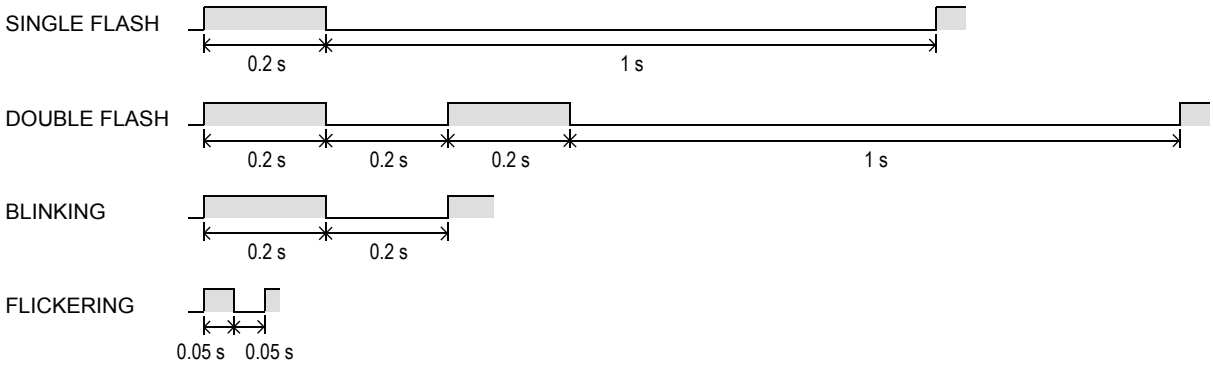
3. Tx/Rx LED

LED State	Description
OFF	FX3U-CAN is not transmitting or receiving CAN messages.
ON	FX3U-CAN is transmitting or receiving CAN messages.

4. ERROR LED

LED State	Description
OFF	No error
SINGLE FLASH*1	At least one of the error counters of the module has reached or exceeded the error passive level. Check the following points in the network. • Check that the terminating resistors at both ends of the network are connected. • Check that all nodes have the same baud rate setting. • Check that all nodes have a unique Node-Id setting. • Check that the CAN_H, CAN_L and CAN_GND wires are not broken. • Check that the CAN_SHLD is grounded. • Check that the CAN_SHLD is connected at all nodes. • Check that the CAN cable wires do not short circuit other CAN cable wires.
DOUBLE FLASH*1	A NMT guarding failure (NMT-Slave or NMT-Master) or a heartbeat failure has occurred. Check the error status in BFM #29. → **Refer to Section 14.2**
BLINKING*1	General error has occurred. Check the error status in BFM #29. → **Refer to Section 14.2**
FLICKERING*1	LSS Services in progress
ON	FX3U-CAN is in BUS-OFF state, or CPU error occurs in PLC main unit. The LED will always be ON if there is a BUS_OFF error, a general error (BFM #29, bit 0), or the FROM/TO watchdog is expired. • Check the error status in BFM #29. → **Refer to Section 14.2** • Check the ERROR LED of the PLC → **For FX3G Series PLC, refer to FX3G Hardware Edition** → **For FX3GC Series PLC, refer to FX3GC Hardware Edition** → **For FX3U Series PLC, refer to FX3U Hardware Edition** → **For FX3UC Series PLC, refer to FX3UC Hardware Edition** → **For FX5U PLC, refer to MELSEC iQ-F FX5U User's Manual (Hardware)** → **For FX5UC PLC, refer to MELSEC iQ-F FX5UC User's Manual (Hardware)** • Check the sequence program for FROM/TO watchdog. → **For the FROM/TO watchdog, refer to Section 6.9**

*1. ERROR LED has four kinds of flicker states: single flash, double flash, blinking, and flickering. This LED flickers as follows.



5. POWER LED

LED State	Description
Lit	The power is being correctly supplied from FX3G/FX3U/FX3GC[*1]/FX3UC[*1]/FX5U[*2]/FX5UC[*2] PLC via the extension cable to FX3U-CAN.
Otherwise	The power is being incorrectly supplied from FX3G/FX3U/FX3GC[*1]/FX3UC[*1]/FX5U[*2]/FX5UC[*2] PLC via the extension cable to FX3U-CAN. • Check the connection of the extension cable to the PLC. • Check the power supply of the FX3G/FX3U/FX3GC[*1]/FX3UC[*1]/FX5U[*2]/FX5UC[*2] PLC. **→ For FX3G Series PLC, refer to FX3G Hardware Edition** **→ For FX3GC Series PLC, refer to FX3GC Hardware Edition** **→ For FX3U Series PLC, refer to FX3U Hardware Edition** **→ For FX3UC Series PLC, refer to FX3UC Hardware Edition** **→ For FX5U PLC, refer to MELSEC iQ-F FX5U User's Manual (Hardware)** **→ For FX5UC PLC, refer to MELSEC iQ-F FX5UC User's Manual (Hardware)** **→ For power supply specifications for FX3U-CAN, refer to Section 2.2**

*1. An FX2NC-CNV-IF or FX3UC-1PS-5V is necessary to connect the FX3U-CAN to an FX3GC/FX3UC Series PLC.

*2. An FX5-CNV-BUS or FX5-CNV-BUSC is necessary to connect the FX3U-CAN to an FX5U/FX5UC PLC.

14.2 Detail Error Check

Please check the bit status of Error Status in BFM #29.

Note

- The error flags b5, b6, b8, b10, b13 and b15 are latched, and it is necessary to write K0 to the appropriate bit of BFM #29 or the whole BFM, which will clear all latched error flags in BFM #29.
  All other bits are reset automatically if the cause for the error is resolved.
- In case of a FROM/TO watchdog timer error (bit 7 is ON), the following message will be sent to the network.
  If the module is in a CANopen® Mode the module will switch to CANopen® State Stopped.
  → For the FROM/TO watchdog, refer to Section 6.9
  - When CANopen® 405/417 mode is used
    FX3U-CAN transmits the EMCY Object (emergency message) on the CAN network.
    → For the EMCY Object (emergency message), refer to Subsection 5.6.13 and Section 6.23
  - When the 11 bit / 29 bit CAN-ID Layer 2 mode is used
    FX3U-CAN transmits the PLC RUN>STOP message on the CAN network.
    → For the PLC RUN>STOP message, refer to Section 9.6

Module failures

The module stays in initial status (Displayed in BFM #25). The CANopen® configuration may be faulty. Reset the Object Dictionary to default settings using the CIF.
→ For Restore Object Dictionary default settings, refer to Section 10.7
→ For module restart, refer to Section 6.8

Bit No.	Description	
Bit 0	General error	General error has occurred. This bit is ON if bit 1, 2, 3, 4, 5, 6, 7, 8, 10, 11, 12 or 15 are ON. Check the ON bit.
Bit 1	Hardware error	Hardware error has occurred. If this error flag is not cleared after a module reset (BFM #25 bit 0) or another power cycle, FX3U-CAN is probably damaged. Please contact your local Mitsubishi Electric representative. **→ For module restart, refer to Section 6.8**
Bit 2	Internal power supply error	Internal power supply error has occurred. If this error flag is not cleared after a module reset (BFM #25 bit 0) or another power cycle, FX3U-CAN is probably damaged. Please contact your local Mitsubishi Electric representative. **→ For module restart, refer to Section 6.8**

Bit No.	Description	
Bit 3	CAN bus off error	The FX3U-CAN is bus OFF. The FX3U-CAN has too many transmission errors. Check the following points in the network. And then, turn on the power for PLC again or restart the FX3U-CAN. → **For module restart, refer to Section 6.8** • Check that the terminating resistors at both ends of the network are connected. • Check that all nodes have the same baud rate setting. • Check that all nodes have a unique Node-Id setting. • Check that the CAN_H, CAN_L and CAN_GND wires are not broken. • Check that the CAN_SHLD is grounded. • Check that the CAN_SHLD is connected at all nodes. • Check that the CAN cable wires do not short circuit other CAN cable wires.
Bit 4	FLASH memory error	FLASH memory error has occurred. Invalid data in the Flash memory might be caused by power loss during a write operation to the Flash ROM. If this error flag is not cleared after a module reset (BFM #25 bit 0) or another power cycle, please contact your local Mitsubishi Electric representative. → **For module restart, refer to Section 6.8**
Bit 5	• CANopen® modes: Write access while module is in initialisation mode. Write to BFMs, after BFM #25 bit 7 is OFF. → **For the communication status (BFM #25), refer to Section 6.8** • Layer 2 mode: Invalid write access to configuration BFM while in online/initialisation mode. Do not write to configuration BFM when module is online. Write to configuration BFMs, after switching to configuration mode and off line mode. → **For the communication status (BFM #25), refer to Section 6.8** This failure is displayed in BFM #40.	
Bit 6	BFM setting error	BFM setting error has occurred. ON when a value that is out of range is written to a BFM. This failure BFM address is displayed in BFM #39. In Layer 2 mode, this bit can not be reset while the module is in online mode. → **For BFM #39, refer to Section 6.17**
Bit 7	FROM/TO watchdog timer error	FROM/TO watchdog timer expired. Please see the above note. This error flag can be reset by writing to BFM #26. → **For the FROM/TO watchdog, refer to Section 6.9**
Bit 8	Internal data queue overflow	Internal data queue overflowed. Extreme bus load can cause the internal queues to overflow. Decrease the bus load. At a low baud rate, data exchange that is too fast can overflow the CAN Transmit Buffer (Depends also on the bus-load of the CAN). → **For Data Exchange Control flag, refer to Section 6.4**
Bit 9	Reserved	
Bit 10	CANopen® NMT Error Control failure	CANopen® NMT Error Control failure has occurred. At least one of the assigned NMT slaves failed during NMT Error Control. → **For NMT Error Control failure, refer to Section 6.24**
Bit 11	Baud rate change error	Baud rate change error has occurred. ON when an invalid baud rate is written to BFM #24. In this case, the BFM will keep its former value. → **For the baud rate setting, refer to Section 6.7**
Bit 12	Node address change error	Node address change error has occurred. ON when an invalid node address is written to BFM #27. In this case, the BFM will keep its former value. → **For the node address setting, refer to Section 6.10**
Bit 13	CANopen® emergency	CANopen® emergency message was received from the assigned slave. → **For the emergency message, refer to Section 6.23**
Bit 14	CAN error passive state	This flag shows the CAN error active state/passive state*1. OFF: Error active state CAN reception error counter value is in the range of K0 to K127. ON: Error passive state CAN reception error counter value is K128. This bit will be reset automatically if the internal error counters return back to below K128. → **For the CAN transmission error counter, refer to Section 6.13** → **For the CAN reception error counter, refer to Section 6.14**
Bit 15	Layer 2 Message specific error	Layer 2 Message specific error exists. Check the Layer 2 Message specific error code in BFM #401 to #442. → **For the Layer 2 Message specific error code, refer to Section 9.2**

*1. Any CANopen® node will check all CAN messages on the bus for errors. Depending on the error state, the action that the node will take is different:
- In error active:
  The node will actively mark the frame as invalid.
- In error passive:
  The node will not actively mark the frame as invalid to avoid bus disturbance if the node itself has an H/W problem.

Warranty

Please confirm the following product warranty details before using this product.

1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company. However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

[Gratis Warranty Term]

The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place. Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

[Gratis Warranty Range]

(1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.

(2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
   1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
   2. Failure caused by unapproved modifications, etc., to the product by the user.
   3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
   4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
   5. Relay failure or output contact failure caused by usage beyond the specified Life of contact (cycles).
   6. Failure caused by external irresistible forces such as fires or abnormal voltages, and failure caused by force majeure such as earthquakes, lightning, wind and water damage.
   7. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
   8. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

2. Onerous repair term after discontinuation of production

(1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued.
Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.

(2) Product supply (including repair parts) is not available after production is discontinued.

3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

(1) Damages caused by any cause found not to be the responsibility of Mitsubishi.

(2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.

(3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.

(4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

5. Changes in product specifications

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.

6. Product application

(1) In using the Mitsubishi MELSEC programmable logic controller, the usage conditions shall be that the application will not lead to a major accident even if any problem or fault should occur in the programmable logic controller device, and that backup and fail-safe functions are systematically provided outside of the device for any problem or fault.

(2) The Mitsubishi programmable logic controller has been designed and manufactured for applications in general industries, etc. Thus, applications in which the public could be affected such as in nuclear power plants and other power plants operated by respective power companies, and applications in which a special quality assurance system is required, such as for Railway companies or Public service purposes shall be excluded from the programmable logic controller applications.
In addition, applications in which human life or property that could be greatly affected, such as in aircraft, medical applications, incineration and fuel devices, manned transportation, equipment for recreation and amusement, and safety devices, shall also be excluded from the programmable logic controller range of applications.
However, in certain cases, some applications may be possible, providing the user consults their local Mitsubishi representative outlining the special requirements of the project, and providing that all parties concerned agree to the special circumstances, solely at the users discretion.

Revised History

Date	Revision	Description
4/2012	A	First Edition
12/2013	B	• Firmware version 1.10 is supported. - The following objects are added: Index H100C, Index H100D, Index H1020, Index H102A - The following Buffer memories are added: BFM #70, BFM #71, BFM #10000 to 10319, BFM #11000 to #11319, BFM #12000 to #12539, BFM #13000 to #13539 - Supports BFM #20 bit 8,9 and 12. - The following error codes are added: H3111, H3121, H8F01 to H8F7F • Default value of communication parameter is added. [Section 5.6] • Default value of mapping parameter is added. • The explanation of Communication Profile Area is modified. [Section 5.6] • The explanation of RPDO/TPDO is modified. [Subsection 5.6.5] • The explanation of SYNC is modified. [Subsection 5.6.7] • The explanation of Node guarding is modified. [Subsection 5.6.8] • The explanation of Time is modified. [Subsection 5.6.10] • The contents of protocol NMT is added. [Subsection 5.8.3] • The contents of NMT slave identification is added. [Subsection 5.8.4] • The explanation of NMT master startup is modified. [Subsection 5.8.5] • The explanation of NMT slave startup is modified. [Subsection 5.8.6] • The explanation of NMT slave assignment is modified. [Subsection 5.8.7] • The contents of NMT Bootup / Error event handling is added. [Subsection 5.8.8] • The explanation of Application Profile CiA® 417 V2.1 for Lift Control Systems is modified. [Section 5.10] • The explanation of Flying master is modified. [Subsection 5.8.11] • The explanation of LSS is modified. [Subsection 5.8.12] • The explanation of Configuration manager is modified. [Subsection 5.8.13] • The explanation of Allocation of Buffer Memories is modified. [Chapter 6] • The explanation of CANopen® 405 Mode is modified. [Chapter 7] • The explanation of CANopen® 417 Mode is modified. [Chapter 8] • The explanation of Pre-defined Layer 2 receive messages is modified. [Subsection 9.3.2] • The contents of CIF Multi SDO read access is added. [Subsection 10.2.2] • The contents of CIF Multi SDO write access is added. [Subsection 10.2.4] • The explanation of Send an Emergency Message is modified. [Section 10.5] • The contents of PLC RUN/STOP is added. [Chapter 11] • Partial correction • Errors are corrected.
4/2015	C	• A part of the cover design is changed.
8/2016	D	• Firmware version 1.12 is supported. - Connection to FX5U/FX5UC PLC. • The contents of power down message is removed.
