CONTENTS

1. AD51-S3 SYSTEM SUBROUTINES **1-1~1-9**

- 1.1 Retry Time Setting 1-3
- 1.2 Set Data for Calling System Subroutine 1-4
- 1.3 Errors Resulting from System Subroutine Execution 1-9

2. BASIC COMMANDS **2-1~2-9**

3. SYSTEM SUBROUTINES **3-1~3-65**

- 3.1 System Subroutines Which Do Not Access the PC CPU 3-1
- 3.2 System Subroutines Which Access the PC CPU 3-10

1. AD51-S3 SYSTEM SUBROUTINES

Table 1 shows system subroutines which are used by the AD51-S3 to access the programmable controller CPU.

Item			System Sub-routine	Processing	Number of Points Processed per AD51-S3, PC CPU Transaction	PC CPU State	
						During STOP	During RUN
Device memory	Batch read	Bit	SADR	Reads data from bit device (such as X, Y, and M) (for 1 point).	256 points	○	○
		Word		Reads data from bit devices (such as X, Y, and M) (for 16 points).	32 words (512 points)		
				Reads data from word device (such as D and R) (for 1 point).	64 points		
	Batch write	Bit	SADW	Writes data to bit device (such as X, Y, and M) (for 1 point).	160 points	○	○
		Word		Writes data to bit devices (such as X, Y, and M) (for 16 points).	10 words (160 points)		
				Writes data to word device (such as D and R) (for 1 point).	64 points		
	Test (during random write)	Bit	SADT	Sets/resets any specified bit device (such as X, Y, and M) and device number (for 1 point).	20 points	○	○
		Word		Sets/resets any specified bit devices (such as X, Y, and M) and device number (for 16 points).	10 words (160 points)		
				Writes data to any specified word device (such as D and R) and device number (for 1 point).	10 points		
	Monitor data entry	Bit	SADM0	Defines the bit device (such as X, Y, and M) to be monitored (for 1 point).	40 points*	○	○
		Word		Defines the bit devices (such as X, Y, and M) to be monitored (for 16 points).	20 words* (320 points)		
				Defines the word device (such as D and R) to be monitored (for 1 point).	20 points		
Monitor	Bit	SADM1	Monitors the device specified in monitor data entry.	/	○	○	
	Word						
Sequence program	Read	Main	SAAR	Reads main sequence program.	64 steps	○	○
		Sub		Reads subsequence program.			
	Write	Main	SAAW	Writes main sequence program.		○	×
		Sub		Writes subsequence program.			
Parameter	Read		SAPR	Reads parameters of PC CPU.	128 bytes	○	○
	Write		SAPW	Writes parameters of PC CPU.		○	×
	Analysis request		SAPS	Causes PC CPU to recognize and check rewritten parameters.	/	○	×

Table 1 System Subroutine List (Continue)

Item		System Sub-routine	Processing	Number of Points Processed per AD51, PC CPU Transaction	PC CPU State	
					During STOP	During RUN
PC CPU	Remote RUN	SKR	Requests remote RUN of PC CPU.			
	Remote STOP	SKP	Requests remote STOP of PC CPU.			
	PC type mode	SPC	Reads PC CPU type (A0J2, A1, A2, or A3).		○	○
Buffer memory	Batch read	SR2	Reads data from buffer memory.	128 bytes	○	○
	Batch write	SW2	Writes data to buffer memory.			
Extension file register	Batch read	SAER	Reads extension file register (R) data from PC CPU.	64 points	○	○
	Batch write	SAEW	Writes extension file register (R) data to PC CPU.			
	Test (during random write)	SAET	Writes data to any specified extension file register (R) and device number (for 1 point).	10 points		
	Monitor data entry	SAEM0	Defines the extension file register (R) to be monitored (for 1 point).	20 points		
	Monitor	SAEM1	Monitors the extension file register specified in monitor data entry (SAEM0).			
Microcomputer program	Read	Main	Reads main microcomputer program.	128 bytes	○	○
		Sub	Reads submicrocomputer program.			
	Write	Main	Writes main microcomputer program.		○	×
		Sub	Writes submicrocomputer program.			
Comment	Batch read	SACR	Reads comments of PC CPU.	128 bytes	○	○
	Batch write	SACW	Writes comments of PC CPU.			
Special function module buffer memory	Batch read	SATR	Reads data from special function module buffer memory.	128 bytes	○	○
	Batch write	SATW	Writes data to special function module buffer memory.			

Table 1 System Subroutine List

In the PC CPU State column of Table 1, ○ indicates that the system subroutine can be executed and × indicates that it cannot be executed.

When the A1(E), A2(E), A3(E), A1N, A2N or A3N CPU is used, half the number of points marked * is processed for device X (input).

This does not apply to the A0J2 and A3H CPU.

1.1 Retry Time Setting

The AD51-S3 accesses the PC CPU via its buffer memory (OS area). When the PC CPU is accessing the AD51-S3 buffer memory (using the **FROM**/**TO** instruction), the AD51-S3 cannot access the PC CPU. Hence, access must be retried until the PC CPU is accessed by the AD51-S3. The period of time required until access is made is referred to as retry time. The retry time defaults to 10ms. It can be changed between 0 and 255ms using system subroutine "SC2." The retry time value is common to all tasks. Retry is not executed if the retry time is set to 0.

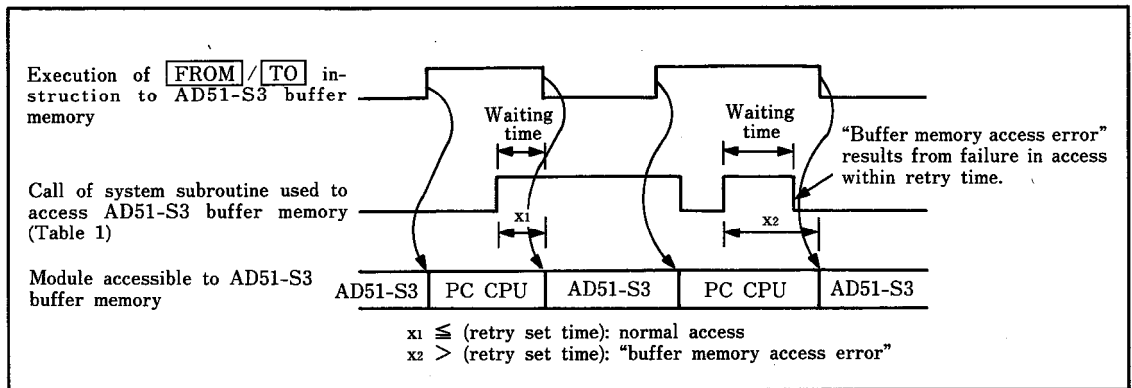

Fig. 1 Retry Time

1.2 Set Data for Calling System Subroutine

(1) PC No. (0 to 64, FF_H)

The PC number specified for any subroutine must be 0 to 64 or FF_H.

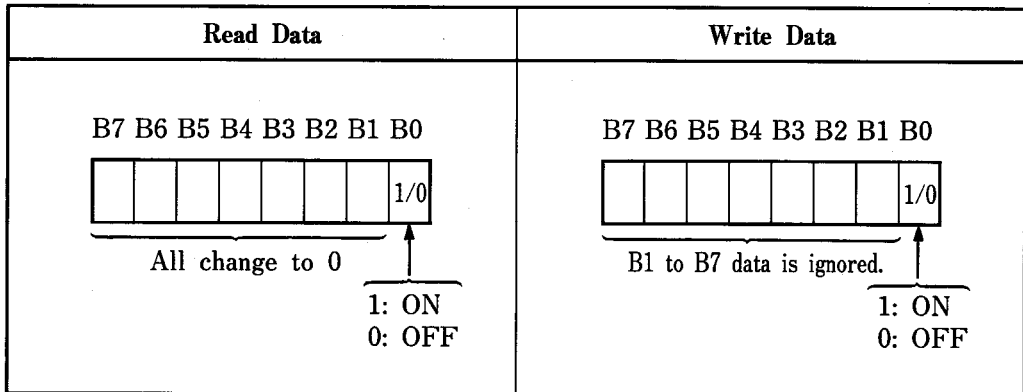

(2) Bit/word designation

Specify bit or word for the data processed.

Bit/Word designation	Character Setting
Bit designation	B (42 _H)
Word designation	W (57 _H)

[Bit designation]

A bit device is accessed in units of 1 point. Any word device cannot be accessed. Processed data has the following bit locations:

[Word Designation]

Both word and bit devices can be specified. Word (W) must be specified to read/write data from/to any word device.

Bit devices are accessed in units of 1 word (16-points). The ON/OFF data of 16 points, from (head device) to (head device + 15), is stored to bit devices, from B0 onward. 1 indicates ON and 0 OFF. The following data configuration assumes that the head device is X10.

(3) Head device

Note the following when setting the head device to be accessed. Table 2 shows the device setting ranges.

1) Bit and word devices are classified as follows:

- Bit devices — X, Y, M, L, B, F, T (contact), T (coil), C (contact), C (coil)
- Word devices — T (present value), C (present value), D, W, R

2) For word designation, the bit device number must be a multiple of 16.

3) Specify the device number with five characters (ASCII) in the range shown in Table 2. A blank code (20_H) may be used instead of "0" in the upper digits (e.g. marked ~ as in X0070).

4) The range of M specified in Table 2 may be used as that of L and vice versa.

Bit Device				Word Device		
Device		Device number range (character)	Decimal/hexadecimal	Device	Device number range (character)	Decimal/hexadecimal
Input	X	X0000 to X07FF	Hexadecimal	Timer (present value) T	TN000 to TN255	Decimal
Output	Y	Y0000 to Y07FF	Hexadecimal		Counter (present value) C	CN000 to CN255
Internal relay	M	M0000 to M2047	Decimal	Data register D		D0000 to D1023
Latch relay	L	L0000 to L2047	Decimal	Link register W	W0000 to W03FF	Hexadecimal
Step relay	S	S0000 to S2047	Decimal	File register R	R0000 to R8191	Decimal
Link relay	B	B0000 to B03FF	Hexadecimal	Special register D	D9000 to D9255	Decimal
Annunciator	F	F0000 to F0255	Decimal	/		
Special relay	M	M9000 to M9255				
Timer (constant)	T	TS000 to TS255				
Timer (coil)	T	TC000 to TC255				
Counter (contact)	C	CS000 to CS255				
Counter (coil)	C	CC000 to CC255				

Table 2 Device Setting Ranges

(4) Main/sub designation

Specify main program or subprogram when reading and writing a sequence program and/or T/C set value.

The main program must be specified when the A1(E), A2(E), A1N, A2N or A0J2CPU is accessed.

Program	Character Setting
Main program	M (4D _H)
Subprogram	S (53 _H)

(5) Head steps for read and write

To read and write T/C set values, specify the following numbers:

Sequence Program	Step
T0 set value T1 set value to T255 set value	FE00 _H FE01 _H to FEFF _H
C0 set value C1 set value to C255 set value	FF00 _H FF01 _H to FFFF _H
Step 0 Step 1 to Step 30719 (30K)	0000 _H 0001 _H to 77FF _H

Calculation of step specified

Timer: $T_m = FE00_H + n$

Counter: $C_m = FF00_H + n$

where m = device number

n = device number in hexadecimal

(6) T/C set values

To read and write T/C set values, specify the following numbers:

Constant	Set Value	Data Register	Set Value
K0	0000 _H	D0	8000 _H
K1	0001 _H	D1	8002 _H
K2	0001 _H	D2	8004 _H
to	to	to	to
K32766	7FFE _H	D1022	81FC _H
K32767	7FFF _H	D1023	81FE _H

(7) Time check value

When the AD51-S3 accesses the PC CPU, set waiting time (between issuance of a processing request from the AD51-S3 to the PC CPU and a replay from the PC CPU) in increments of 10msec. A "time-out error" occurs if access to the PC CPU is not complete within the time check period. The set value should be 2 to FFFF_H (20 to 655350ms). 0 or 1 is accounted for as 2 (20ms).

Access to the PC CPU by the AD51-S3 is made once when the **END**, **FEND**, or **COM** instruction is executed in the sequence program. Requests for communication transactions with the PC CPU may also come from other sources, these are listed below and are processed in the same way as AD51-S3 transaction requests. Only one transaction may be processed per PC CPU scan so that a delay of 1 to 5 scans is possible before the AD51-S3 transaction is processed if several of these requests overlap.

1. PC CPU OS program
2. Peripheral equipment (e.g. A6GPP)
3. Optical or coaxial data link module incorporated the CPU module
A1(E)CPUP21/R21, A2(E)CPUP21/R21, A3(E)CPUP21/R21
4. Optical or coaxial data link module in 3 hierarchy system
AJ71P22, AJ72R22
5. Processing request from AJ71C24-S3 or second AD51-S3

[Example]

If the PC CPU scan time is 100msec and continuous processing requests are received from the A6GPP and AJ71C24-S3, communication between the AD51-S3 and PC CPU is only made once every three scans. Hence, set the time check value to 30 (300ms) or greater.

1.3 Errors Resulting from System Subroutine Execution

The following table lists errors which occur by the execution of system subroutines in Table 1 used by the AD51-S3 to access the PC CPU. When any of the following errors occurs, the corresponding error code is written to registers (H) and (L). These error codes are common to the system subroutines. For other codes, see the corresponding system subroutines.

Code	Error	Remarks
2	PC access error	PC CPU hardware fault.
4	Input data error	Invalid data set for system subroutine execution.
5	Write (or entry) data error	Invalid data set to address specified at (B)(C)+4, +5.
6	No data entry	No device has been entered using system subroutine SADM0.
7	PC running	Access cannot be made during PC CPU RUN.
8	Buffer memory access error	Retry time should be increased using system subroutine "SC2."
9	Time out error	Processing has not been completed within a time check period.
10	PC down error	PC CPU has been reset or is faulty.
-1	PC No. error	The set PC No. is not accessible.
-4	Other data error	<ul style="list-style-type: none"> ● Subprogram has been specified for the A0J2, A1(E) or A2(E)CPU, or the A3(E)CPU which has no subprogram. ● Write has been attempted to ROM area of the PC CPU.
-9	Remote error	Remote RUN/STOP is being executed from another module.
-17	Link error	Fault has occurred in MELSECNET.

2. BASIC COMMANDS

The following BASIC commands have been added or corrected to the AD51-S3. For full information, refer to the relevant pages.

Command	Reference Page
CLOSE	2-2
LOCATE	2-3
OPEN	2-4
ZIDV	2-7
ZODV	2-8

CLOSE

TYPE D

PRG

FUNCTION

Closes the RS-232C or RS-422 channel.

FORM

CLOSE channel number

EXPLANATION

- Closes the RS-232C or RS-422 channel opened by the OPEN command.
- Channel number defined should be the one specified for the OPEN command.

CAUTION

When the CLOSE command is executed, data in the send/receive buffer is made invalid.

EXAMPLE

```
OK
>LIST
100 REM "EXERCISE"
110 OPEN $4, $5C, $37, 4 .....Channel 4 of RS-232C is opened to enable communication.
120 FOR I= 0 TO 10
130 A = I * I
140 ZODV2
150 PRINT A
160 NEXT I
170 ZTIME 300
180 CLOSE $4 .....Channel 4 of RS-232C is closed.
190 END
OK
>
```

LOCATE

TYPE C

PRG

FUNCTION

Specifies the cursor position on the screen.

FORM

LOCATE line position, column position

EXPLANATION

- The line and column positions may be specified by expressions.
- The line and column positions can be specified within the following ranges:

	Screen Mode
Line	0 to 128
Column	0 to 128

EXAMPLE

Indicates that the 640 × 400 mode standard screen has been specified.

```
OK
>LIST REM "EXERCISE"
110 CLS
120 FOR I = 0 TO 16
130 LOCATE I, I * 2
140 PRINT "@"
150 NEXT I
160 END
```

```
OK
>RUN
```

@'s are displayed from (0, 0) to (16, 32) as shown on the right.

CAUTION

The line and column position setting ranges are the area that the OS can process. As the setting ranges differ in accordance with the general-purpose terminal connected, the ranges specified should meet the specifications of the general-purpose terminal used.

OPEN

TYPE D

PRG

FUNCTION

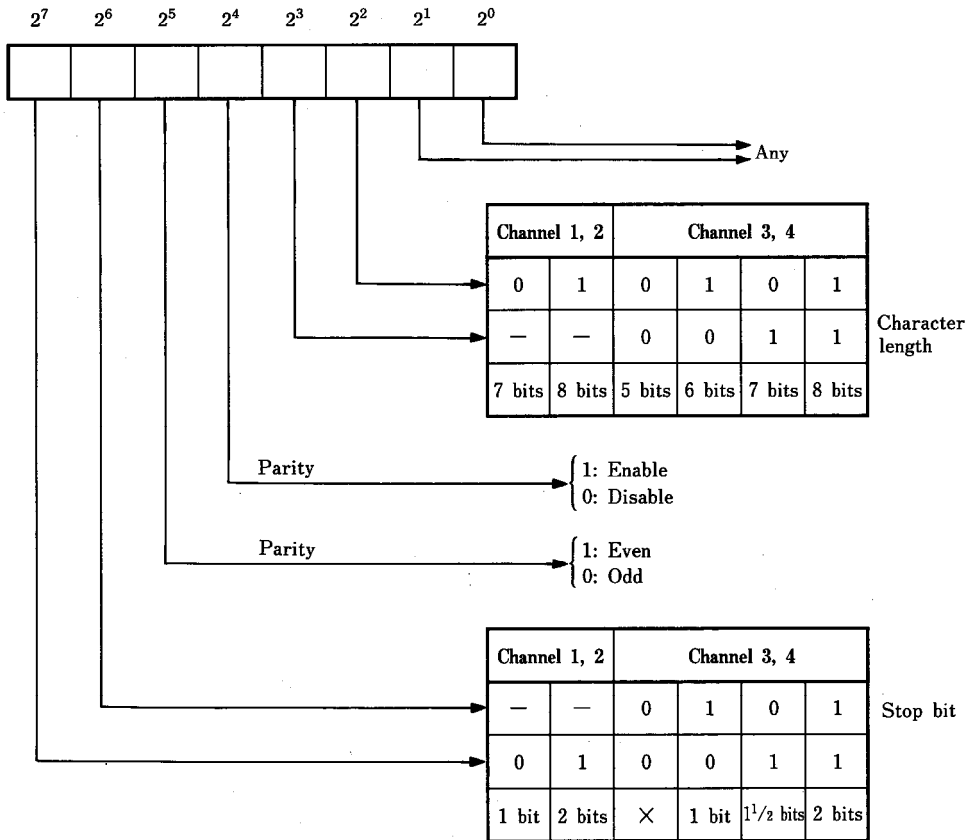

Opens the RS-232C or RS-422 channel to enable communication processing.

FORM

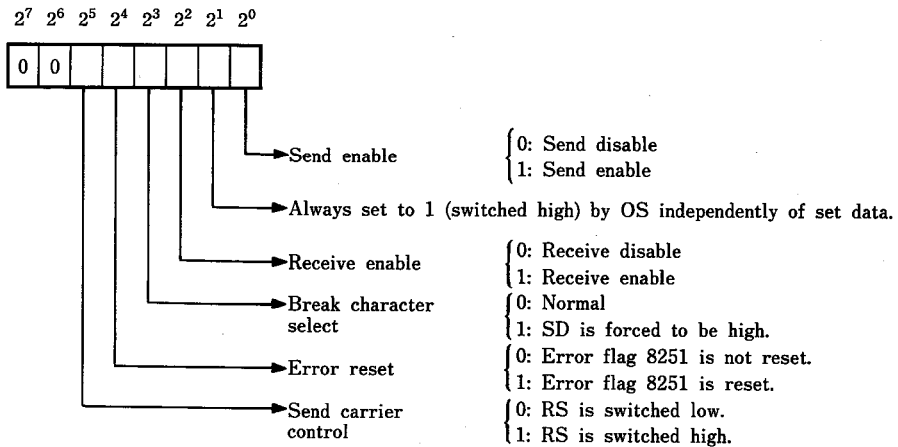

OPEN channel number, variable 1, variable 2, variable 3

EXPLANATION

- Opens the RS-232C or RS-422 channel specified in channel number.
- When the block data receive (SRB) or block data transmission (SWB) system subroutine is used, the channel must have be opened by executing the OPEN statement.
- Specify any of 1 to 4 as channel number.
- Define communication mode in variable 1, which has the following structure in binary:

- Define a command in variable 2, each digit of which is 1 in binary and indicates the following:

- Define a baud rate in variable 3 in accordance with the following table:

	1	2	3	4	5	6
Baud rate	300	600	1200	2400	4800	9600

NOTE

1. For full information on communication mode and commands, see the manual attached to the LSI8251.
2. The commands usually execute the following functions:
 36_H : Receive only.
 33_H : Transmission only.
 37_H : Both receive and transmission.
3. The data terminal ready (DTR) signal of channels 1, 3 and 4 must be switched on by the OS.
 The DTR signal is not available for channel 2.
4. Any data may be set for channels 1 and 2 because these channels do not have break character select and send carrier control.
5. When the OPEN command is executed, the I/O buffer is initialized and its data is made invalid.

EXAMPLE 1

```
OK
>LIST
100 REM "EXERCISE"
110 OPEN 4, $5C, $37, 4 ..... Given setting is performed on RS-232C channel 4 to enable
120 A = $E300 ..... transmission.
130 A (0) = $6000
140 A (1) = $4100
150 A (2) = 10
160 B=CALL ($0, $800C, 2, $E300).....System subroutine SWB is called.
170 END
OK
>RUN
OK
```

Data from address \$ 6000 on in the common area is sent to the equipment connected to RS-232C channel 4 using the block data send (SWB) command.

After opening the channel, start communication using the SWB or SRB command.

EXAMPLE 2

The following example indicates the data written in BASIC to open the channel connected to the K6PRE, K7PRE or KD51PR.

```
OPEN X, $7F, $37, 4 .....K6PRE
OPEN X, $CF, $37, 4 .....K7PRE
OPEN X, $4F, $37, 5 .....KD51PR
```

(X depends on the channel connected.)

FUNCTION

Switches the input console.

FORM

ZIDV channel number

EXPLANATION

- Allows data to be entered from any keyboard using the INPUT or INKEY command.
- When BASIC is started, the keyboard used is automatically set to the one connected to the channel specified by the DIP switch SW16.
- Define the channel number as appropriate in accordance with the following table:

Number	Channel Connected with Input Console
0	Depends on the setting of DIP switch SW16 on the AD51-S3 front. ON: RS-422 channel 1 OFF: RS-232C channel 3
1	RS-422 channel 1
2	RS-422 channel 2
3	RS-232C channel 3
4	RS-232C channel 4

EXAMPLE

```
OK
>LIST
100 REM "EXERCISE"
105 OPEN 2, $5E, $37, 4 ..... RS-422 channel 2 is opened.
110 ZIDV 2 ..... Keyboard connected to RS-422 channel 2 is specified as the
120 A=INKEY ..... one used for key input in line 120.
130 PRINT $A
140 GOTO 120
150 END
OK
>RUN
41 ..... "A" has been entered from the keyboard connected to
RS-422 channel 2.
42 ..... "B" has been entered from the keyboard connected to RS-422
channel 2.
43 ..... "C" has been entered from the keyboard connected to RS-422
channel 2.
44 ..... "D" has been entered from the keyboard connected to
RS-422 channel 2.
```

FUNCTION

Switches the output console.

FORM

ZODV channel number

EXPLANATION

- Allows data to be output to any output console using any of the following command:

Command	Command
CLS	ZCON
LOCATE	ZCRV
PRINT	ZNOR
ZCOFF	

- When BASIC is started, the CRT used is automatically set to the one connected to the channel specified by the DIP switch SW16.

Number	Channel Connected with Output Console
0	Depends on the setting of DIP switch SW16 on the AD51-S3 front. ON: RS-422 channel 1 OFF: RS-232C channel 3
1	RS-422 channel 1
2	RS-422 channel 2
3	RS-232C channel 3
4	RS-232C channel 4

EXAMPLE

```
OK
>LIST
 100 REM "EXERCISE"
 105 OPEN 1, $ 5 8, $ 3 7, 5 .....RS-422 channel 1 is opened.
 110 ZODV 1 .....Output console connected to RS-422 channel 1 is specified.
 120 PRINT "MITSUBISHI"
 130 END
OK
>RUN....."MITSUBISHI" is displayed on the output console connected
OK      to RS-422 channel 1.
>
```

3. SYSTEM SUBROUTINES

System subroutines added to the AD51-S3 are largely classified into those which access the PC CPU and those which do not.

3.1 System Subroutines Which Do Not Access the PC CPU

System Subroutine	Refer To
SCB	3-2
SCA	3-3
SHX	3-4
SHD	3-5
STC	3-6
SRP	3-7
SFIXD	3-8
SFLTD	3-9

SCB

TYPE	B
------	---

FUNCTION

Reads the current time of day from the clock element and stores it to the memory, starting at the address specified at registers (B) and (C).

INPUT

Registers (D), (E).....Channel for storing the time of day read from the clock element.

Registers (B), (C).....Head address of memory for storing the time of day read from the clock element.

OUTPUT

Stores the execution result to registers (H), (L).

Registers (H), (L)	Judgement
0	The time of day has been read from the clock element and stored to the memory without fault, beginning with the address specified at registers (B), (C).
1	Channel error (The channel is invalid for the value in registers (D), (E).)
2	Time-out (The time of day cannot be read from the clock element after a given period of time.)

(B)(C)+0	Second
1	Minute
2	Hour
3	Day
4	Month
5	Year

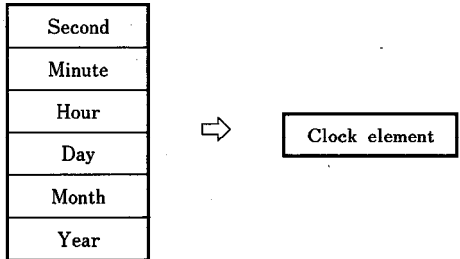

NOTE
The time of day read is all stored in binary.

SCA

TYPE	B
------	---

FUNCTION

Writes the set data (year, month, day, hour, minute and second) to the clock element.

INPUT

Registers (D), (E).....Define the channel containing the set data.

Registers (B), (C).....Define the head address of the set data.

Set data.....Define the year, month, day, hour, minute and second to (B), (C) + 0 to 5.

(B)(C)+0	Second
1	Minute
2	Hour
3	Day
4	Month
5	Year

OUTPUT

Stores the execution result to registers (H), (L).

Registers (H), (L)	Judgement
0	Data has been written to the clock element without fault.
1	Channel error (The channel is invalid for the value in registers (D), (E).)
4	Data error (The set data is in error.)

NOTE
All set data should be defined in binary.

SHX

TYPE	B
------	---

FUNCTION

Controls data communication for the specified RS-232C or RS-422 channel.

Transmission

- Stops data transmission to the external device on receiving the Xoff code.
- Resumes data transmission to the external device on receiving the Xon code.

Receive

- Sends the Xoff code when the empty area of the receive buffer becomes 7 bytes or less.
- Sends the Xon code when the empty area of the receive buffer becomes 32 bytes or more.

Xon Code	Xoff Code
11 _H	13 _H

INPUT

Registers (D), (E).....Define the required channel of RS-232C or RS422.

OUTPUT

Stores the execution result to registers (H), (L).

Registers (H), (L)	Judgement
0	SHX is complete without fault.
1	Channel error

NOTE
<ol style="list-style-type: none">1. Data transmission to the external computer or personal computer can be controlled by the Xon/Xoff codes.2. After SHX is called, 11_H and 13_H are used as the Xon and Xoff codes respectively.3. The A6GPP cannot be controlled by the Xon/Xoff codes. If SHX is called, the A6GPP regards the Xon/Xoff codes as ordinary data.4. Calling SHD returns control to SHD.5. Selecting CH2 results in an error because transmission control is not given to CH2.

SHD

TYPE	B
------	---

FUNCTION

Controls data communication of the used channel via the Data Set Ready (DSR) terminal.

Trans-
mission

DSR State	High	Low
Transmission	Executed	Not executed

INPUT

Registers (D), (E)..... Define the channel used (1 to 4).

OUTPUT

Stores the execution result to registers (H), (L).

Registers (H), (L)	Judgement
0	SHD is complete without fault.
1	Channel error

NOTE

1. During receive
Off indicates that the empty area of the AD51-S3 receive buffer is 7 bytes or less.
On indicates that the empty area of the AD51-S3 receive buffer is 32 bytes or more.
2. During transmission
Switch on DTR when the empty area of the AD51-S3 receive buffer is 5 bytes or more.
3. The Xon/Xoff codes are treated as data.
4. Data communication control defaults to SHD.
RS422 channel 2 does not have the DSR and DTR terminals and is not under communication control.

STC

FUNCTION

Reads the number of bytes remaining in the AD51-S3 send buffer. Call STC to monitor the number of remaining bytes in the buffer and whether or not data has actually been transmitted from the AD51-S3 to the external device.

INPUT

Registers (D), (E).....RS232C or RS422 channel (1 to 4)

OUTPUT

Registers (H), (L)..... { Number of remaining bytes under normal condition
FFFF_H(-1)..... Channel error

SRP

FUNCTION

Reads the RS232C and RS422 port status.

INPUT

Registers (D), (E) Port channel (1 to 4)

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
Other than -1	SRP is complete without fault.
-1	Channel error

When SRP is complete without any fault, 0 is stored to register (H) and the following data to register (L):

Channel Number	Register (L) Contents																
Channel 1	<table border="1"> <tr> <td>B7</td><td>B6</td><td>B5</td><td>B4</td><td>B3</td><td>B2</td><td>B1</td><td>B0</td> </tr> <tr> <td>RDRF</td><td>OVRN</td><td>PE</td><td>FE</td><td>RIF</td><td>$\overline{\text{DCD}}_0$</td><td>TDRE</td><td>TIE</td> </tr> </table>	B7	B6	B5	B4	B3	B2	B1	B0	RDRF	OVRN	PE	FE	RIF	$\overline{\text{DCD}}_0$	TDRE	TIE
B7	B6	B5	B4	B3	B2	B1	B0										
RDRF	OVRN	PE	FE	RIF	$\overline{\text{DCD}}_0$	TDRE	TIE										
Channel 2	<table border="1"> <tr> <td>B7</td><td>B6</td><td>B5</td><td>B4</td><td>B3</td><td>B2</td><td>B1</td><td>B0</td> </tr> <tr> <td>RDRF</td><td>OVRN</td><td>PE</td><td>FE</td><td>RIF</td><td>CTS1E</td><td>TDRE</td><td>TIE</td> </tr> </table>	B7	B6	B5	B4	B3	B2	B1	B0	RDRF	OVRN	PE	FE	RIF	CTS1E	TDRE	TIE
B7	B6	B5	B4	B3	B2	B1	B0

Channels 1, 2 HD64180

Channels 3, 4 M5L8251

SFIXD

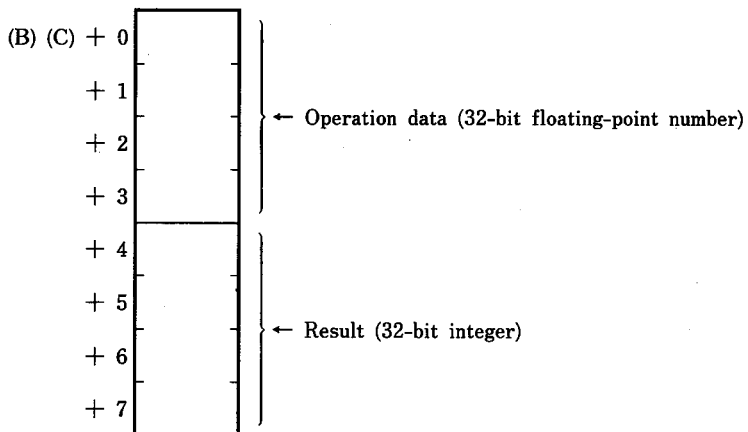

FUNCTION

Converts a 32-bit floating-point number into a 32-bit integer.

INPUT

(D), (E) Channel for storing the following set data.

(B), (C) Head address of the following set data.

OUTPUT

Stores the execution result to registers (H), (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
3	Operation element error
5	Overflow

SFLTD

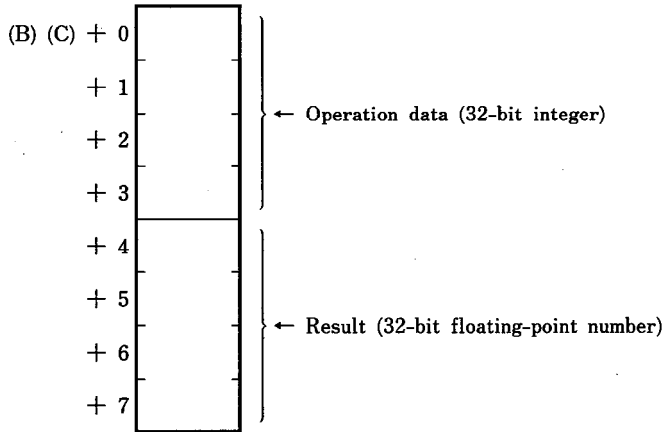

FUNCTION

Converts a 32-bit integer into a 32-bit floating-point number.

INPUT

(D), (E) Channel containing the following set data.

(B), (C) Head address of the following set data.

OUTPUT

Stores the execution result to registers (H), (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
3	Operation element error

3.2 System Subroutines Which Access the PC CPU

Input and output data for use of the following system subroutines is given in Chapter 1.

System Subroutine	Refer To	System Subroutine	Refer To
SPC	3-11	SAPS	3-39
SKC	3-12	SIT	3-40
SKR	3-13	SIR	3-41
SKP	3-14	SC2	3-42
SR2	3-15	SAER	3-43
SW2	3-17	SAEW	3-45
SADR	3-19	SAET	3-47
SADW	3-21	SAEM0	3-50
SADT	3-23	SAEM1	3-52
SADM0	3-26	SAMR	3-54
SADM1	3-29	SAMW	3-56
SAAR	3-31	SACR	3-58
SAAW	3-33	SACW	3-60
SAPR	3-35	SATR	3-62
SAPW	3-37	SATW	3-64

SPC

TYPE	B
------	---

FUNCTION

Identifies the PC CPU loaded.

INPUT

Registers (D), (E)..... PC No. (0 to 64, FF_H)

Registers (B), (C)..... Time check value (10ms increments)
20 to 655350ms

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
100	A0J2CPU
101	A1CPU, A1ECP, A1NCP
102	A2CPU, A2ECP, A2NCP
103	A3CPU, A3ECP, A3NCP
104	A3HCP
2	PC access error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SKC

TYPE	B
------	---

FUNCTION

Checks the RUN/STOP state of the loaded PC CPU.

INPUT

Registers (D), (E).....PC No. (0 to 64, FF_H)

Registers (B), (C).....Time check value (10ms increments)
20 to 655350ms (2 to FFFF_H)

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	STOP
1	RUN
2	PC access error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SKR

TYPE	B
------	---

FUNCTION

Requests remote run of the PC CPU.

INPUT

Registers (D), (E).....PC No. (0 to 64, FF_H)

Registers (B), (C).....Time check value (10ms increments)
20 to 655350ms (2 to FFFF_H)

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
2	PC access error
8	Buffer memory access error
9	Time-out
10	PC down error
FFFF _H (-1)	PC No. error
FFF7 _H (-9)	Remote error
FFEF _H (-17)	Link error

NOTE

The clearing of the data memory on receiving a remote run instruction depends on the states of special relays M9016 and M9017.

Special Relay		Data Memory Status
M9016	M9017	
OFF	OFF	CPU is run without clearing the data memory.
OFF	ON	Data memory is cleared outside the latch range set in the parameters. (Link image X is not cleared.)
ON	ON/OFF	CPU is run after the data memory is cleared.

SKP

TYPE	B
------	---

FUNCTION

Requests remote stop of the PC CPU.

INPUT

Registers (D), (E)..... PC No. (0 to 64, FF_H)

Registers (B), (C)..... Time check value (10ms increments)
20 to 655350ms (2 to FFFF_H)

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
2	PC access error
8	Buffer memory access error
9	Time-out
10	PC down error
FFFF _H (-1)	PC No. error
FFF7 _H (-9)	Remote error
FFEF _H (-17)	Link error

SR2

FUNCTION

Reads data from the buffer memory.

INPUT

Registers (D), (E).....Channel containing the following data

Registers (B), (C).....Head address of the following data

(B) (C) + 0	00 _H L	} ← Buffer memory head address (0 to BFF _H)
+ 1	02 _H H	
+ 2	00 _H L	} ← Destination head address
+ 3	F0 _H H	
+ 4	00 _H L	} ← Number of words read (1 to C00 _H)
+ 5	01 _H H	

The above example is based on the following conditions:

Buffer memory head address	: 200 _H
Destination head address	: F000 _H
Number of words read	: 256 words

For the programming procedure, see Section 7.2.1 (1) in the AD51-S3 User's Manual.

OUTPUT

Stores the result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
4	Input data error
8	Buffer memory access error

Destination head address

SW2

FUNCTION

Writes data to the buffer memory.

INPUT

Registers (D), (E).....Channel containing the following data

Registers (B), (C).....Head address of the following data

(B) (C) + 0	50 _H L	} ← Buffer memory head address (0 to BFF _H)
+ 1	03 _H H	
+ 2	00 _H L	} ← Source head address
+ 3	E7 _H H	
+ 4	40 _H L	} ← Number of words to be written (1 to C00 _H)
+ 5	00 _H H	

The above example is based on the following conditions:

Buffer memory head address	: 350 _H
Source head address	: E700 _H
Number of words to be written	: 64 words

For the programming procedure, see the Section 7.2.1 (2) in the AD51-S3 User's Manual.

Source head address

OUTPUT

Stores the result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
4	Input data error
8	Buffer memory access error

SADR

FUNCTION

Reads data from the device memory of the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	57 _H	← Bit/word designation { Bit: "B" = 42 _H Word: "W" = 57 _H
+ 2	"X"	← Source head device (stored in character code)
+ 3	"0"	
+ 4	"1"	
+ 5	"0"	
+ 6	"0"	
+ 7	L 1	← Number of points to be read { Bit designated: max. 256 points Word designated: (Bit device → max. 32 words Word device → max. 64 points)
+ 8	H	
+ 9	00 _H L	← Destination head address
+ 10	E0 _H H	
+ 11	L 60	← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)
+ 12	H	

The above example is based on the following conditions:

PC station number	: Host = FF _H
Bit/word designation	: Word designation = 57 _H
Source head device	: X100 = "X0100"
Number of points read	: 16 points (1 word)
Destination head address	: E000 _H
Time check period	: 600ms

For the programming procedure, see Section 7.3.2 (1) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

Destination head address

SADW

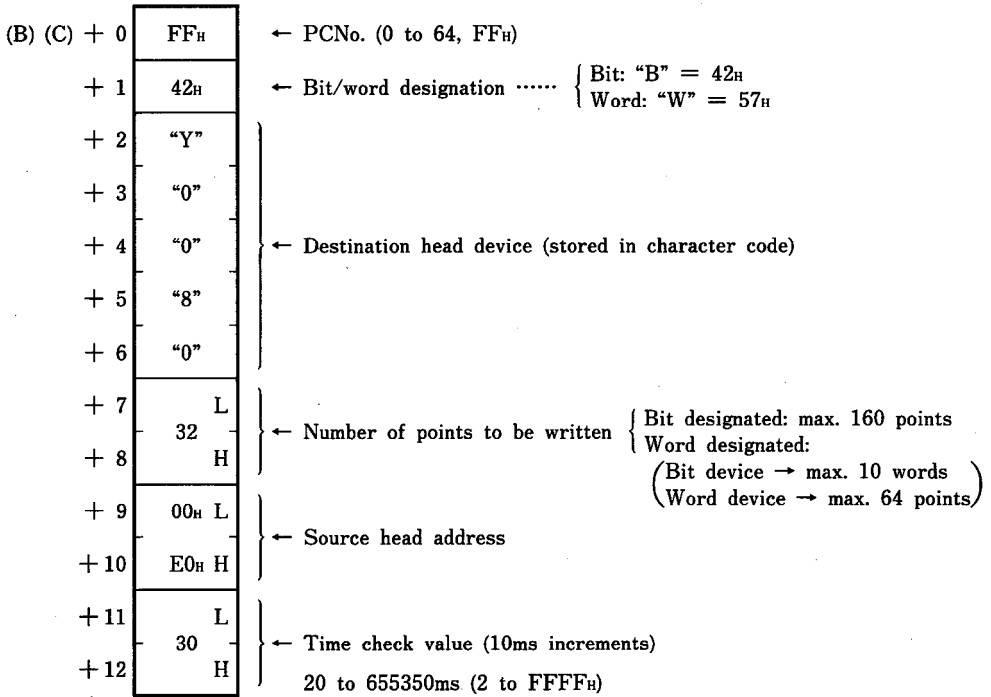

FUNCTION

Writes data to the device memory of the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Bit/word designation	: Bit designation = 42 _H
Destination head device	: Y80 = "Y0080"
Number of points written	: 32 points
Source head address	: E000 _H
Time check period	: 300ms

For the programming procedure, see Section 7.3.2 (2) in the AD51-S3 User's Manual.

Source head address

OUTPUT

Stores the execution result to register (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SADT

FUNCTION

Writes any specified data to the device memory of the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

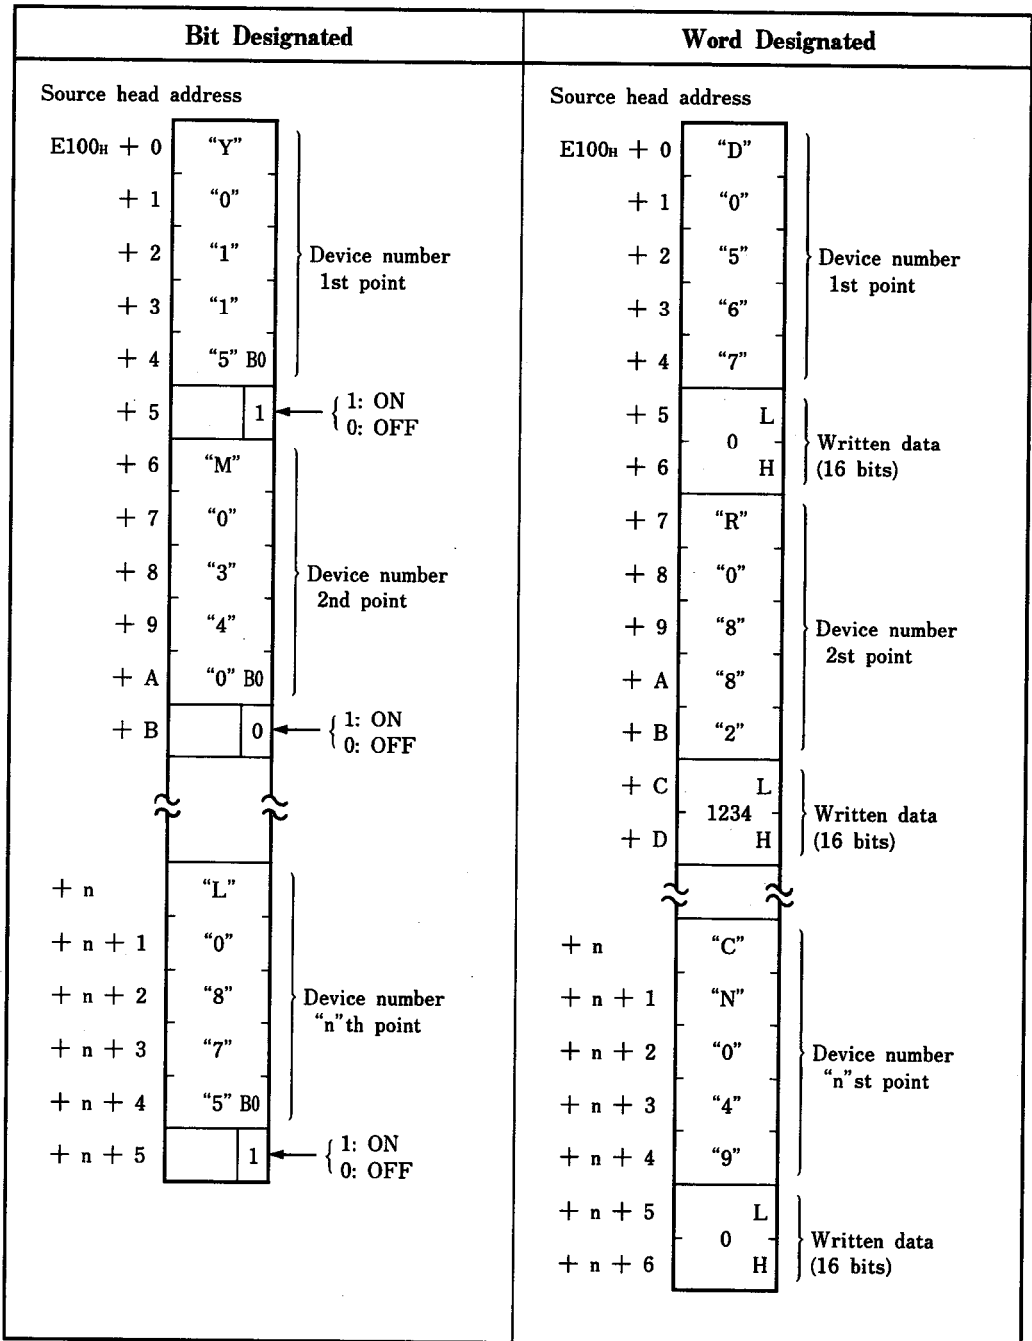

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	57 _H	← Bit/word designation { Bit: "B" = 42 _H Word: "W" = 57 _H
+ 2	L	← Number of points to be written { Bit designated: max. 20 points Word designated: max. 10 points (10 words)
+ 3	4 H	
+ 4	00 _H L	← Source head address
+ 5	E1 _H H	
+ 6	L	← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)
+ 7	70 H	

The above example is based on the following conditions:

PC station number	: Host = FF _H
Bit/word designation	: Word designation = 57 _H
Number of points written	: 4 points
Source head address	: E100 _H
Time check period	: 700ms

For the programming procedure, see Section 7.3.2 (3) in the AD51-S3 User's Manual.

Written data format

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
5	Write data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SADMO

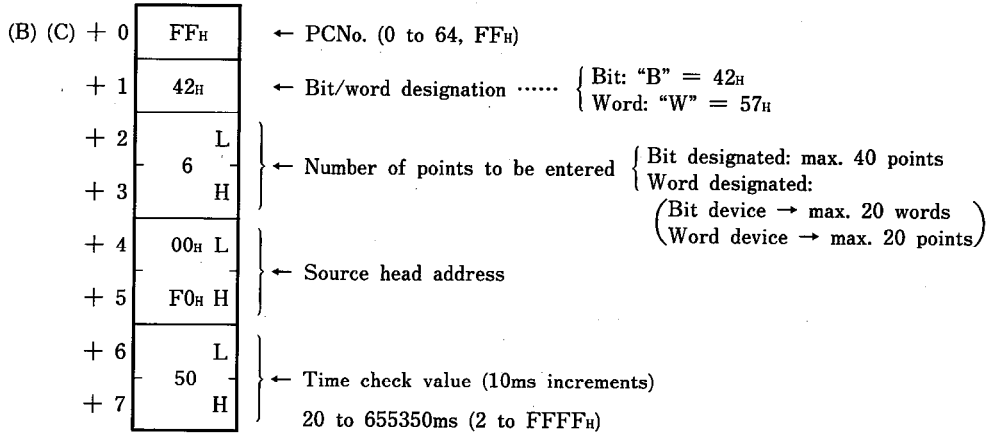

FUNCTION

Enters the device to be monitored into the AD51-S3.

INPUT

Registers (D), (E)..... Channel containing the following set data.

Registers (B), (C)..... Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Bit/word designation	: Bit designation = 42 _H
Number of points entered	: 6 points
Source head address	: F000 _H
Time check period	: 500ms

For the programming procedure, see Section 7.3.2 (4) in the AD51-S3 User's Manual.

Source head address

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
5	Entry data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SADM1

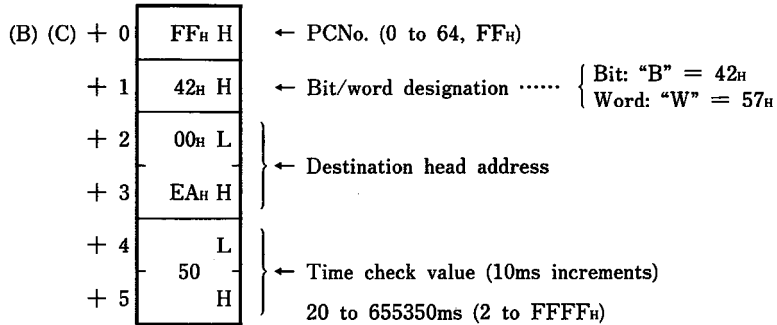

FUNCTION

Monitors the device entered by monitor data entry (SADM0).

INPUT

Registers (D), (E) ← Channel containing the following set data.

Registers (B), (C) ← Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Bit/word designation	: Bit designation = 42 _H
Destination head address	: EA00 _H
Time check period	: 500ms

For the programming procedure, see Section 7.3.2 (5) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
6	No data entered
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

Destination head address

SAAR

FUNCTION

Reads the sequence program and T/C set values.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	4D _H	← Main/sub designation { Main: "M" = 4D _H Sub: "S" = 53 _H
+ 2	L	← Source head step
+ 3	0 H	
+ 4	L	← Number of steps read (1 to 64)
+ 5	64 H	
+ 6	00 _H L	← Destination head address
+ 7	E0 _H H	
+ 8	L	← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)
+ 9	60 H	

The above example is based on the following conditions:

PC station number	: Host = FF _H
Main/sub designation	: Main program = 4D _H
Source head step	: Step 0
Number of steps read	: 64 steps
Destination head address	: E000 _H
Time check period	: 600ms

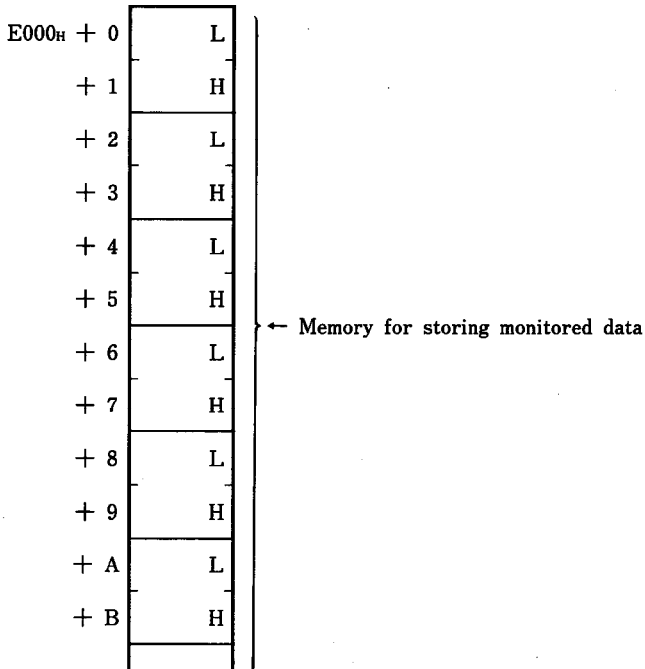

For the programming procedure, see Section 7.6.3 (1) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error
FFFC _H (-4)	Other data error

Destination head address

SAAW

FUNCTION

Writes the sequence program and T/C set values.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	4D _H	← Main/sub designation { Main: "M" = 4D _H Sub: "S" = 53 _H
+ 2	L	} ← Destination head step
+ 3	0 H	
+ 4	L	} ← Number of steps written (1 to 64)
+ 5	64 H	
+ 6	00 _H L	} ← Source head address
+ 7	E0 _H H	
+ 8	L	} ← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)
+ 9	70 H	

The above example is based on the following conditions:

PC station number	: Host = FF _H
Main/sub designation	: Main program = 4D _H
Destination head step	: Step 0
Number of steps written	: 64 steps
Source head address	: E000 _H
Time check period	: 700ms

For the programming procedure, see Section 7.6.3 (2) in the AD51-S3 User's Manual.

Source head address

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
7	Write disable during PC RUN
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFFC _H (-4)	Other data error
FFEF _H (-17)	Link error

SAPR

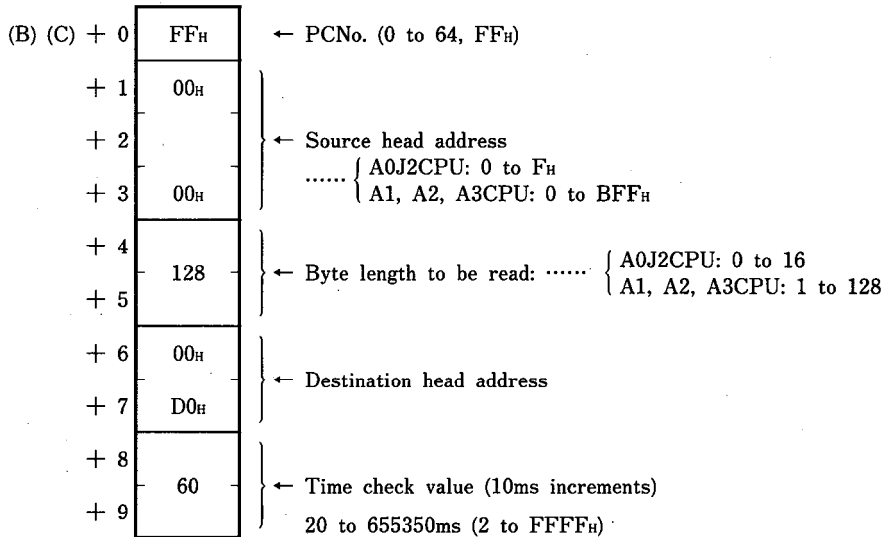

FUNCTION

Reads parameters from the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

- PC station number : Host = FF_H
- Source head address : 0_H
- Byte length to be read : 128 bytes
- Destination head address : D000_H
- Time check period : 600ms

For the programming procedure, see Section 7.6.3 (1) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

Destination head address

SAPW

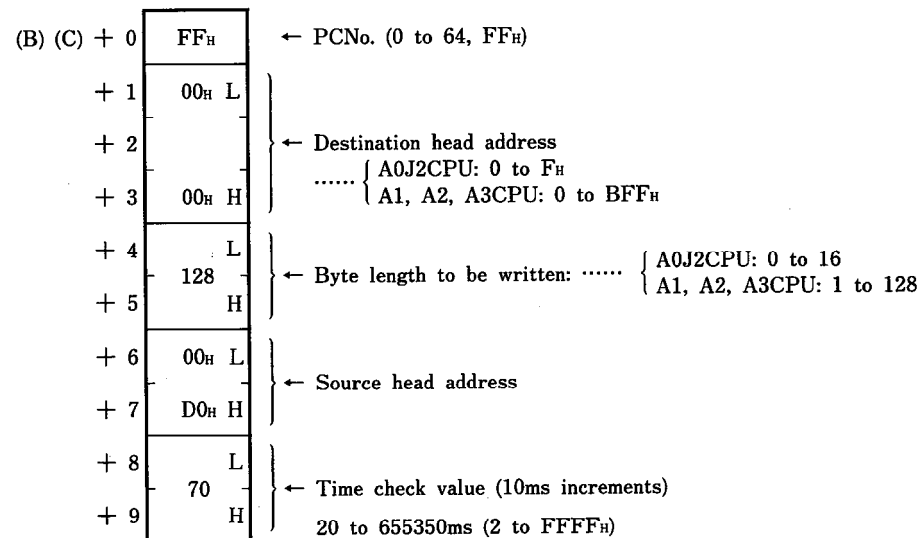

FUNCTION

Writes data to the parameter area of the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Destination head address	: 0 _H
Byte length written	: 128 bytes
Source head address	: D000 _H
Time check period	: 700ms

For the programming procedure, see Section 7.6.3 (2) in the AD51-S3 User's Manual.

Source head address

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
7	Write disable during PC RUN
8	Buffer memory access error
9	Time-out
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SAPS

FUNCTION

Gives a PC CPU parameter analysis request.

INPUT

Registers (D), (E)..... PC No. (0 to 64, FF_H)

Registers (B), (C)..... Time check value (10ms increments)
20 to 655350ms (2 to FFFF_H)

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
2	PC access error
7	Write disable during PC RUN
8	Buffer memory access error
9	Time-out
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SIT

FUNCTION

Interrupts the PC CPU and starts an interrupt sequence program.

INPUT

None

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	SIT is complete without fault.

NOTE

SIT interrupts the PC CPU and stores 0 to registers (H) and (L). The execution time of the PC CPU interrupt program is given in the AD51-S3 User's Manual.

SIR

FUNCTION

Reads the error code currently being indicated on the AD51-S3 display.

INPUT

Registers (D), (E) ← Channel of the area for storing the error flag

Registers (B), (C) ← Head address of the area for storing the error flag

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	SIR is complete without fault.
1	Channel error

The following data is stored when SIR is complete without fault:

When an error exists, the corresponding error code is stored in 2-digit BCD.
When an error does not exist, FF_H is stored.

Channels (D), (E)		
(B) (C) + 0	Error code currently being displayed	{ Multitask setting error Stack error Duplex wait or BTWF error BASIC program error STOP error BREAK error Text end error
+ 1		
+ 2	PC CPU access error	
+ 3	ORST error task 1	
+ 4	ORST error task 2	
+ 5	ORST error task 3	
+ 6	ORST error task 4	
+ 7	ORST error task 5	
+ 8	ORST error task 6	
+ 9	ORST error task 7	
+ 10	ORST error task 8	
+ 11	Receive buffer full error CH1	
+ 12	Receive buffer full error CH2	
+ 13	Receive buffer full error CH3	
+ 14	Receive buffer full error CH4	
+ 15	Send buffer full error CH1	
+ 16	Send buffer full error CH2	
+ 17	Send buffer full error CH3	
+ 18	Send buffer full error CH4	
+ 19	AD51 battery error	

SC2

FUNCTION

Defines the retry time.

After the retry time is defined, access is retried until the AD51-S3 can access the PC CPU, which is currently inaccessible because it is executing the FROM / TO instruction to the AD51-S3.

INPUT

Registers (D), (E) ← Define the retry time between 0 and 255 (ms).

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Judgement
0	SC2 is complete without fault.
1	Retry time setting error

NOTE

The retry time defaults to 10ms.

SAER

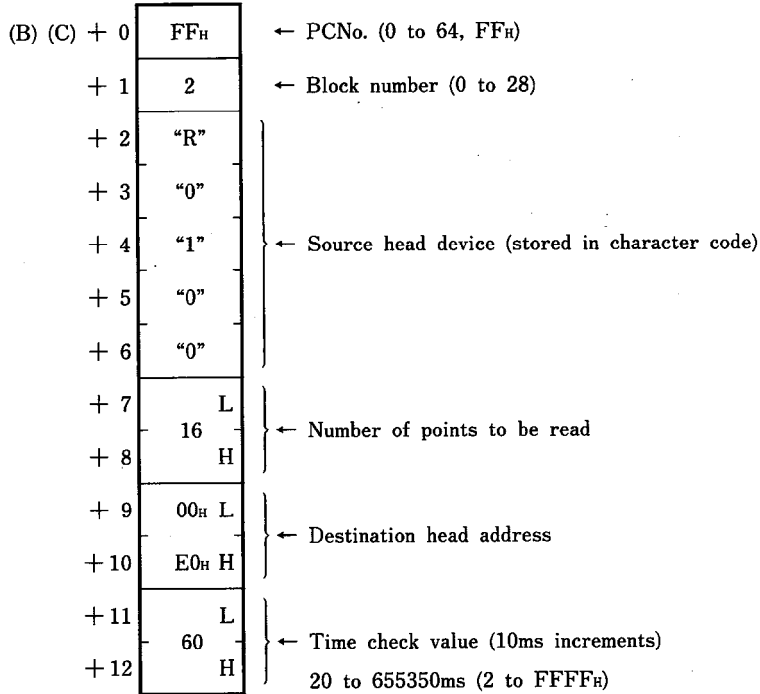

FUNCTION

Reads data from the specified extension file register (R) of the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

- PC station number : Host = FF_H
- Block number : 2
- Source head device : R100 = "R0100"
- Number of points read : 16 points
- Destination head address : E00_H
- Time check period : 600ms

For the programming procedure, see Section 7.4.2 (1) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

Destination head address

SAEW

FUNCTION

Writes data to the specified extension file register (R) of the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	5	← Extension file register block number (0 to 28)
+ 2	"R"	← Destination head device (stored in character code)
+ 3	"0"	
+ 4	"2"	
+ 5	"0"	
+ 6	"0"	
+ 7	L 16	← Number of points to be written (1 to 64)
+ 8	H	
+ 9	00 _H L	← Source head address
+ 10	E0 _H H	
+ 11	L 60	← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)
+ 12	H	

The above example is based on the following conditions:

PC station number	: Host = FF _H
Extension file register block number	: 5
Destination head device	: R200 = "R0200"
Number of points written	: 16 points
Source head address	: E00 _H
Time check period	: 600ms

For the programming procedure, see Section 7.4.2 (2) in the AD51-S3 User's Manual.

Source head address

OUTPUT

Stores the execution result to register (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SAET

FUNCTION

Writes any specified data to the extension file register (R) of the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	02 _H L	} ← Number of points to be written (1 to 10)
+ 2	00 _H H	
+ 3	00 _H L	} ← Source head address
+ 4	FE _H H	
+ 5	60 _H L	} ← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)
+ 6	00 _H H	

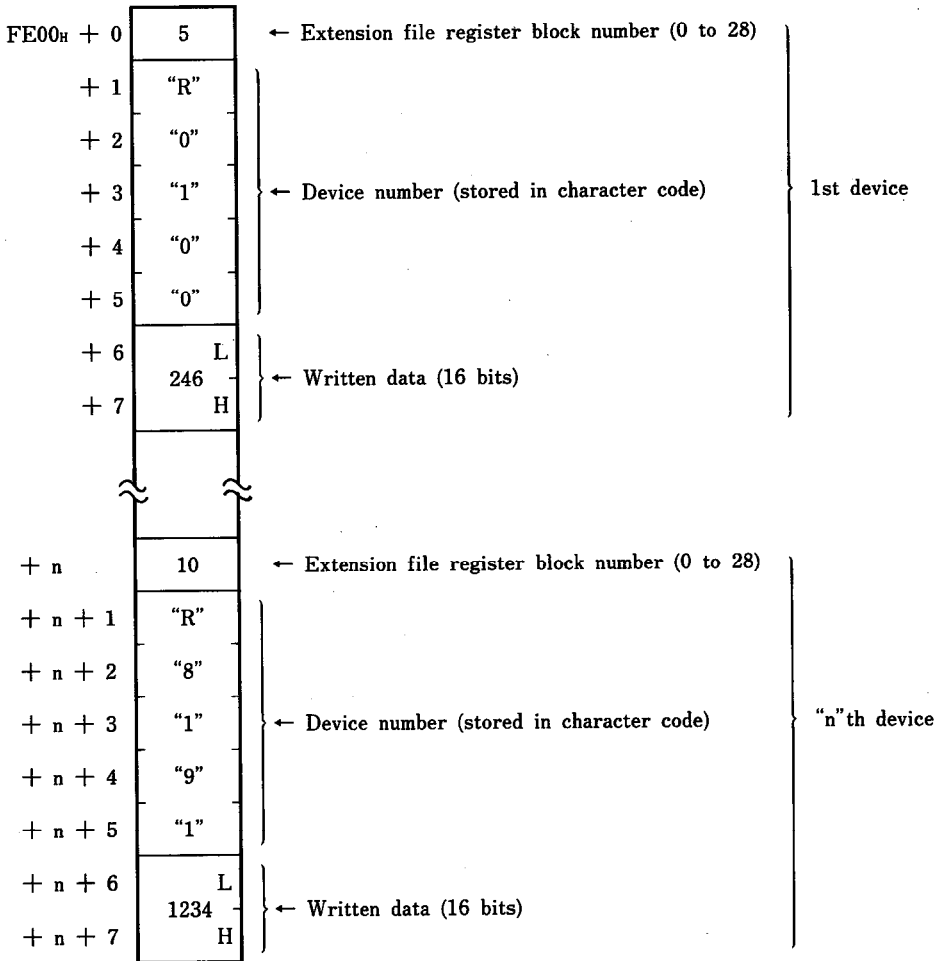

The above example is based on the following conditions:

PC station number : Host = FF_H
 Number of points written to extension file register : 2 points
 Source head address : FE00_H
 Time check period : 600ms

For the programming procedure, see Section 7.4.2 (3) in the AD51-S3 User's Manual.

Written data format

Source head address

The above example is based on the following conditions:

Extension file register block number	: 5	∴	10
Device number	: R100	∴	R8191
Written data	: 246	∴	1234

For the programming procedure, see Section 7.4.2 (3) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
5	Write data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SAEM0

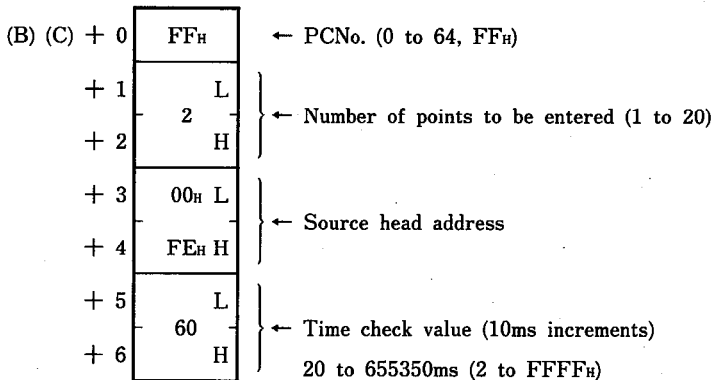

FUNCTION

Enters the extension file register (R) to be monitored.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Number of points entered	: 2 points
Source head address	: FE00 _H
Time check period	: 600ms

For the programming procedure, see Section 7.4.2 (4) in the AD51-S3 User's Manual.

Source head address

SAEM1

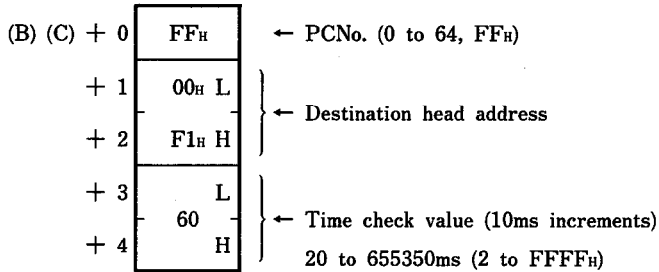

FUNCTION

Monitors the extension file register (R) entered by monitor data entry (SAEM0).

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

- PC station number : Host = FF_H
- Destination head address : 6000_H
- Time check period : 600ms

For the programming procedure, see Section 7.5.2 (5) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
5	Entry data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SAMR

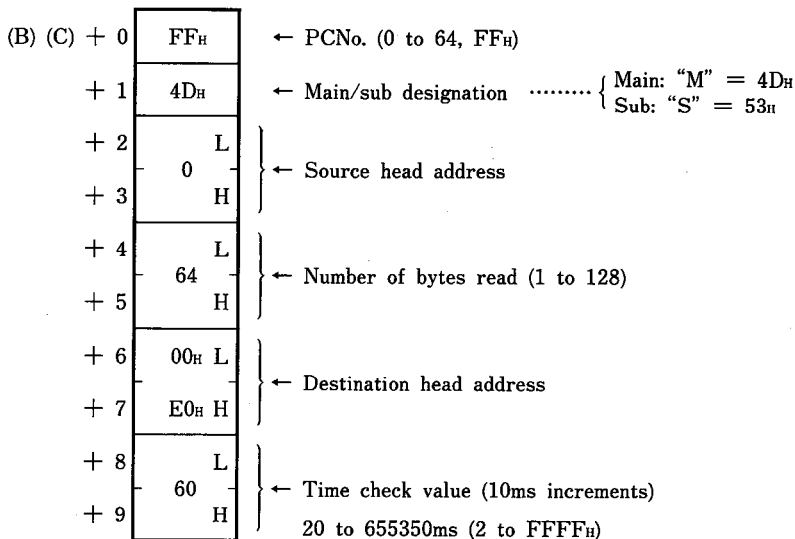

FUNCTION

Reads the microcomputer program from the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Main/sub designation	: Main program = 4D _H
Source head address	: 0 _H
Number of bytes read	: 64 bytes/read
Destination head address	: E000 _H
Time check period	: 600ms

For the programming procedure, see Section 7.7.2 (1) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
6	Entry data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

Source head address

SAMW

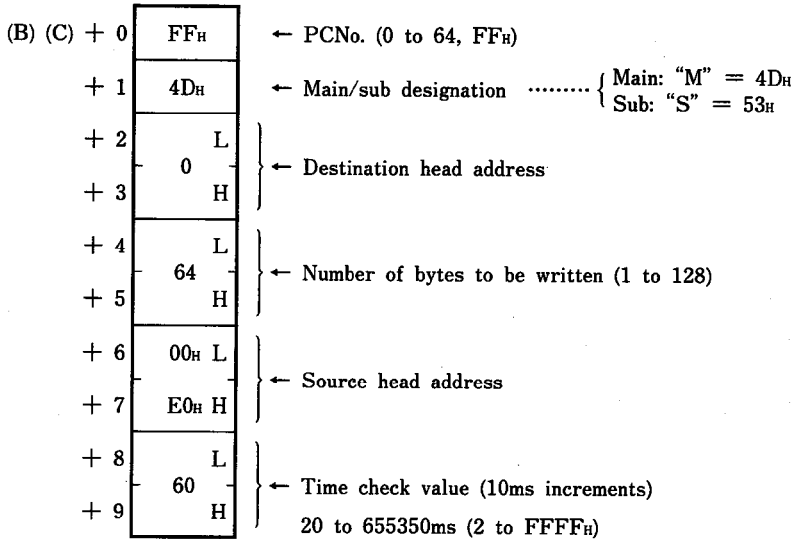

FUNCTION

Writes the microcomputer program to the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

- PC station number : Host = FF_H
- Main/sub designation : Main program = 4D_H
- Destination head address : 0_H
- Number of bytes to be written : 64 bytes/write
- Source head address : E000_H
- Time check period : 600ms

For the programming procedure, see Section 7.7.2 (2) in the AD51-S3 User's Manual.

Source head address

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
7	Write disable during PC RUN
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

SACR

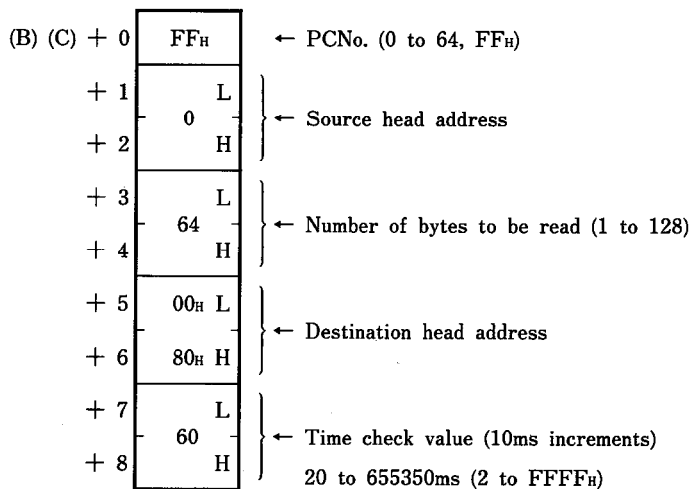

FUNCTION

Reads comments from the PC CPU.

INPUT

Registers (D), (E)..... Channel containing the following set data.

Registers (B), (C)..... Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Source head address	: 0 _H
Number of bytes to be read	: 64 bytes/read
Destination head address	: 8000 _H
Time check period	: 600ms

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

Destination head address

SACW

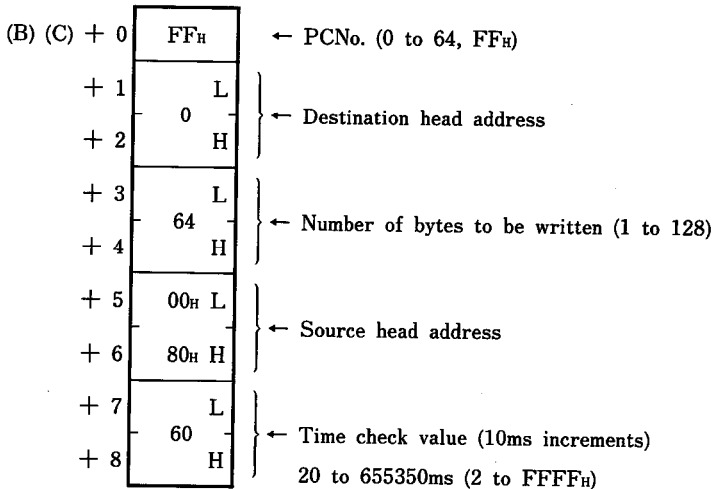

FUNCTION

Writes comment data to the PC CPU.

INPUT

Registers (D), (E).....Channel containing the following set data.

Registers (B), (C).....Head address of the following set data.

The above example is based on the following conditions:

PC station number	: Host = FF _H
Destination head address	: 0 _H
Number of bytes to be written	: 64 bytes/write
Source head address	: 8000 _H
Time check period	: 600ms

Source head address

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
FFFF _H (-1)	PC No. error
FEEF _H (-17)	Link error

SATR

FUNCTION

Reads data from the special function module buffer memory.

INPUT

Registers (D), (E)..... Channel containing the following set data.

Registers (B), (C)..... Head address of the following set data.

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	09 _H	← Special function module number
+ 2	94 _H L	} ← Special function module buffer memory address (address specified from the AD51)
+ 3	00 _H M	
+ 4	00 _H H	
+ 5	04 _H L	
+ 6	00 _H H	} ← Number of bytes to be read (1 to 128)
+ 7	00 _H L	
+ 8	E0 _H H	} ← Destination head address
+ 9	60 _H L	
+ 10	00 _H H	} ← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)

The above example is based on the following conditions:

PC station number	: Host = FF _H
Special function module number	: 9 (AD71 at I/O addresses of 70 _H to 8F _H)
Special function module buffer memory address	: 94 _H
Number of bytes read from special function module to AD51-S3	: 4 bytes
Destination head address	: E000 _H
Time check period	: 600ms

For the programming procedure, see Section 7.4.2 (3) in the AD51-S3 User's Manual.

OUTPUT

Stores the execution result to registers (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
12 _H (18)	Special function module number error
21 _H (33)	Special function module bus error
FFF _H (-1)	PC No. error
FFE _H (-17)	Link error

Destination head address

6000 _H + 0	
+ 1	
+ 2	
+ 3	

The above area has been secured at the time of input setting to store 4-byte data from AD71 buffer memory address 0 (200_H).

SATW

FUNCTION

Writes data to the special function module buffer memory.

INPUT

Registers (D), (E)..... Channel containing the following set data.

Registers (B), (C)..... Head address of the following set data.

(B) (C) + 0	FF _H	← PCNo. (0 to 64, FF _H)
+ 1	0B _H	← Special function module number
+ 2	10 _H L	} ← Special function module buffer memory address (address specified from the AD51)
+ 3	00 _H M	
+ 4	00 _H H	
+ 5	L	} ← Number of bytes to be written (1 to 128)
+ 6	2 H	
+ 7	00 _H L	} ← Source head address
+ 8	EE _H H	
+ 9	L	} ← Time check value (10ms increments) 20 to 655350ms (2 to FFFF _H)
+ 10	60 H	

The above example is based on the following conditions:

PC station number	: Host = FF _H
Special function module number	: 0B _H
Special function module buffer memory address	: 10 _H
Number of bytes to be written	: 2 bytes
Source head address	: EE00 _H
Time check period	: 600ms

Source head address

EE00 _H + 0	L
+ 1	H
+ 2	L
+ 3	H
+ 4	L
+ 5	H
+ 6	L
+ 7	H
+ 8	L
+ 9	H
+ A	L

OUTPUT

Stores the execution result to register (H) and (L).

Registers (H), (L)	Contents
0	Normal completion
1	Channel error
2	PC access error
4	Input data error
8	Buffer memory access error
9	Time-out error
10	PC down error
12 _H (18)	Special function module number error
21 _H (33)	Special function module bus error
FFFF _H (-1)	PC No. error
FFEF _H (-17)	Link error

IMPORTANT

The components on the printed circuit boards will be damaged by static electricity, so avoid handling them directly. If it is necessary to handle them take the following precautions.

- (1) Ground human body and work bench.**
- (2) Do not touch the conductive areas of the printed circuit board and its electrical parts with any non-grounded tools etc.**

Under no circumstances will Mitsubishi Electric be liable or responsible for any consequential damage that may arise as a result of the installation or use of this equipment.

All examples and diagrams shown in this manual are intended only as an aid to understanding the text, not to guarantee operation. Mitsubishi Electric will accept no responsibility for actual use of the product based on these illustrative examples.

Owing to the very great variety in possible applications of this equipment, you must satisfy yourself as to its suitability for your specific application.
